

# **WIDE AREA AUGMENTATION SYSTEM PERFORMANCE ANALYSIS REPORT**

**Report #59**

**Reporting Period: October 1 to December 31, 2016**

**January 2017**

**FAA William J. Hughes Technical Center  
NSTB/WAAS T&E Team  
Atlantic City International Airport, NJ 08405  
<http://www.nstb.tc.faa.gov/>**

## **Executive Summary**

Since 1999, the Wide Area Augmentation System (WAAS) Test Team at the Federal Aviation Administration (FAA) William J. Hughes Technical Center has reported Global Positioning System (GPS) performance as measured against the GPS Standard Positioning Service (SPS) Signal Specification in quarterly GPS Performance Analysis Network (PAN) Reports. In addition to the GPS PAN reports, the WAAS Test Team has provided quarterly reports on WAAS performance. The current WAAS PAN Report #59 provides WAAS-performance data from the October 1 through December 31, 2016 reporting period.

This report provides the following results: accuracy, availability, coverage, safety index, range accuracy, WAAS broadcast message rates, geostationary satellite ranging availability, WAAS airport availability, WAAS Code Noise and Multipath analysis, WAAS reference station survey validation, and WAAS Signal Quality Monitoring.

The WAAS system support modification cutover began August 2015 with the first WAAS system upgrade to G3 receivers on September 4, 2015 in Seattle, WA. This was done in preparation for a full constellation of dual civil frequency GPS satellites (L1/L5). The WAAS system upgrade to G3 receivers was completed on May 17, 2016.

The following table shows observations for accuracy and availability made during the reporting period for Continental United States (CONUS) and Alaska sites (the international sites are presented in the body of this report). Localizer Performance (LP) service is available when the calculated Horizontal Protection Level (HPL) is less than 40 meters. Localizer Performance with Vertical Guidance (LPV) service is available when the calculated HPL is less than 40 meters and the Vertical Protection Level (VPL) is less than 50 meters. Localizer Performance with Vertical Guidance to 200 foot decision height (LPV200) service is available when the calculated HPL is less than 40 meters and the VPL is less than 35 meters. The FAA's National Satellite Test Bed sites—Grand Forks, Atlantic City, and Arcata—are outliers due to receiver quality issues, and not because of the WAAS signal in space quality.

Parameter	CONUS Site/Maximum	CONUS Site/Minimum	Alaska Site/Maximum	Alaska Site/Minimum
95% Horizontal Accuracy (HPL <= 40 meters)	Atlantic City 1.228 meters	Salt Lake City 0.634 meters	Goose Bay 0.799 meters	Bethel 0.587 meters
95% Vertical Accuracy (VPL <= 50 meters)	Miami 1.624 meters	Salt Lake City 0.797 meters	Barrow 1.352 meters	Bethel 1.029 meters
LP Availability (HPL <= 40 meters)	All Sites 100%	All Sites 100%	All Sites 100%	All Sites 100%
LPV Availability (HPL <= 40 meters & VPL <= 50 meters)	All Sites 100%	All Sites 99.99%	Multiple Sites 100%	Barrow 99.99%
LPV200 Availability (HPL <= 40 meters & VPL <= 35 meters)	Multiple Sites 100%	Oakland 99.38%	Multiple Sites 100%	Barrow 99.02%
99% HPL	Atlantic City 16.61 meters	Denver 10.82 meters	Goose Bay 20.99 meters	Juneau 13.16 meters
99% VPL	Arcata 30.62 meters	Kansas 18.92 meters	Barrow 34.23 meters	Fairbanks 24.22 meters

## 1.0 INTRODUCTION

The Federal Aviation Administration (FAA) monitors the Wide Area Augmentation System (WAAS) and Global Positioning System (GPS) Standard Positioning Service (SPS) performance to ensure the safe and effective use of the satellite navigation system in the National Airspace System (NAS). The WAAS augments timely integrity monitoring as well as improves GPS position accuracy and availability within the WAAS coverage area.

The objectives of this report are as listed below:

1. To evaluate and monitor the WAAS ability to augment GPS by characterizing important performance parameters.
2. To analyze the effects of GPS satellite operation and maintenance as well as ionospheric activity on the WAAS performance.
3. To investigate GPS and WAAS anomalies and determine potential user impact.
4. To archive GPS and WAAS performance for future evaluations.

The evaluation utilizes the WAAS data transmitted from geostationary satellites (GEOS) pseudo-random noise (PRN)-135 (CRW), PRN-138 (CRE), and PRN-133 (AMR). CRE and CRW GEOS provide a precision approach (PA) ranging capability that supports all levels of WAAS service. As of January 18, 2015, the AMR GEO indefinitely discontinued non-precision approach (NPA) ranging service.

In this report, the terms "PA" and "NPA" are used in reference of the two modes of user equipment operation. These terms were used in the original WAAS specification, FAA-E-2892. See Table 1-1 for a mapping of PA and NPA to the user service levels.

The receivers in PA mode are required to: (1) use all WAAS corrections, (2) use only corrected satellites, (3) never mix corrections from multiple GEOS, (4) exclusively use the designated Space Based Augmentation System (SBAS) for the published approach procedure, and (5) never use ranging from a GPS or GEO satellite with a User Differential Range Error (UDRE) status of greater than 15 meters. The receiver in NPA mode are allowed to: (1) mix corrected and uncorrected satellites, (2) mix corrections from different GEOS or SBASs, (3) use either the WAAS ionosphere corrections or the GPS Klobuchar model for ionosphere corrections, and (4) use ranging from a GPS or GEO satellite with a UDRE status of greater than 15 meters. The receivers in NPA mode can also operate using Fault Detection/Fault Detection Exclusion (FD/FDE) in the absence of an SBAS. The data presented in this report does not take credit for the additional NPA mode availability and continuity through use of either full or partial FD/FDE, which allowed the mixing of corrected and uncorrected satellites. To remain conservative, the NPA accuracy data presented in this report uses Klobuchar ionosphere corrections.

The results in this report are based on the application of the WAAS corrections to receiver data from the WAAS network and the FAA's National Satellite Test Bed (NSTB) network, and from analyses based on the WAAS-broadcasted correction data. Table 1-2 lists the receivers used in the PA analyses, and Table 1-3 lists the receivers used in the NPA analyses.

**Table 1-1 WAAS Service Levels**

User Service	NPA or PA	WAAS Protection Levels
RNP 0.3	NPA	HPL <= 0.3 nmi
RNP 0.1	NPA	HPL <= 0.1 nmi
LNAV	NPA	HPL <= 556 m
LNAV/VNAV	PA	HPL <= 556 m VPL <= 50 m
LP	PA	HPL <= 40 m
LPV	PA	HPL <= 40 m VPL <= 50 m
LPV200	PA	HPL <= 40 m VPL <= 35 m

The report is divided by the performance category, as listed below:

1. WAAS Position Accuracy
2. WAAS Operational Service Availability
3. WAAS Coverage
4. WAAS Integrity
5. WAAS Range Domain Accuracy
6. WAAS GEO Ranging Performance
7. WAAS Airport Availability
8. WAAS Code Noise and Multipath (CNMP) Analysis
9. WAAS Antenna Survey Validation
10. WAAS Signal Quality Monitor (SQM) Analysis

Table 1-4 lists the evaluated WAAS performance parameters for this report. Note that these are the performance parameters associated with the WAAS system, and these requirements are extracted from the FAA Specification FAA-E-2892C and FAA Specification FAA-E-2976, as applicable.

**Table 1-4 WAAS Performance Parameters**

<b>Performance Parameter</b>	<b>Expected WAAS Performance</b>
LPV Accuracy Horizontal	$\leq 1.5\text{m}$ error 95% of the time
LPV Accuracy Vertical	$\leq 2\text{m}$ error 95% of the time
LNAV Accuracy Horizontal	$\leq 36\text{m}$ error 95% of the time
Availability LPV CONUS	99% availability of 100% of CONUS
Availability LPV Alaska	95% availability of 75% of Alaska
Availability LNAV CONUS	99.99% availability with HPL $< 556\text{m}$
Availability LNAV Alaska	99.9% availability with HPL $< 556\text{m}$
Availability En Route OCONUS	99.9% availability with HPL $< 2\text{nmi}$
Probability of Hazardously Misleading Information (HMI)	$< 10\text{e-}7$ per approach

### 1.1 Event Summary

Table 1-5 lists events that affected WAAS performance, or the ability to determine the WAAS performance, during the reporting period. The events include GPS or WAAS anomalies, relevant receiver malfunctions, receiver maintenance, and ionospheric activity. The reporting of ionospheric activity includes reference to the planetary ( $K_p$ ) index for the event time period. The  $K_p$  index quantifies the disturbance in the earth's magnetic field and is an indicator of solar storms causing geomagnetic disturbances resulting in an unpredictable ionosphere. The detection of an ionospheric disturbance causes the WAAS to increase Grid Ionospheric Vertical Error (GIVE) values making PA service unavailable.

Analyses of events that merit more detailed investigations are documented in the Discrepancy Reports (DRs). The DRs are available at <http://www.nstb.tc.faa.gov> under “WAAS Technical Reports” and also accessible via hyperlink in Table 1-5. Note that “TOW” is the time of GPS week, which is the cumulative number of seconds beginning 00:00:00 Sunday (GMT without leap seconds). Table 1-6 lists events related to WAAS upgrades during this reporting period, and Table 1-7 lists events related to GEO uplink subsystem (GUS) switchovers, which are transitions from one GEO uplink site to the other GEO uplink site.

**Table 1-5 Events**

<b>Start Date</b>	<b>End Date</b>	<b>Location/Satellites</b>	<b>Service Affected</b>	<b>Event Description</b>
10/13/2016	10/13/2016	GEO135,Napa (APC)	LPV200_Alaska, LPV200_Canada	The uplink for the CRW GEO, GEO 135, switched from the Napa uplink site to the Littleton uplink site at 08:09:01 GMT. This caused a 7 second outage of the GEO 135 broadcast and also caused the WAAS carrier smoothing algorithm to reinitialize from PRN135. This also caused the UDRE for GEO 135 to be elevated. The elevated UDREs along with high GIVEs (see event 13535) caused moderate degradation of: (1) LPV200 service coverage in Alaska from 11:23 GMT to 11:55 GMT, and from 15:52 GMT to 16:25 GMT; and (2) LPV200 service coverage in Canada from 15:31 GMT to 15:54 GMT and from 17:08 GMT to 17:59 GMT. TOW 374958-374966 Please see plot(s): <a href="#">LPV200_10/13/2016</a> <a href="#">Cov_vs_Time_Alaska_10/13/2016</a> <a href="#">Cov_vs_Time_Canada_10/13/2016</a>
10/13/2016	10/13/2016	Washington D.C. (CnV), Los Angeles (CnV), Atlanta (CnV)	Local, LPV200_Alaska, LPV200_Canada	Geomagnetic activity (Kp = 6) disturbed the ionosphere causing elevated GIVE values. This also caused multiple Alaska sites to drop satellites due to iono scintillation. The elevated GIVEs along with high UDREs on GEO135 (see event 13524) caused moderate degradation of: (1) LPV200 service coverage in Alaska from 11:23 GMT to 11:55 GMT, and from 15:52 GMT to 16:25 GMT; and (2) LPV200 service coverage in Alaska from 15:31 GMT to 15:54 GMT and from 17:08 GMT to 17:59 GMT. Please see plot(s): <a href="#">LPV200_10/13/2016</a> <a href="#">Cov_vs_Time_Alaska_10/13/2016</a> <a href="#">Cov_vs_Time_Canada_10/13/2016</a>
10/15/2016	10/15/2016	PRN25	Local	GPS satellite PRN25 ephemeris broadcast reused IODE (equal to 98) within 30 minutes on 10/15/16 at 14:00 GMT. <a href="#">DR 134</a>
10/17/2016	10/17/2016	GEO138,Brewster-B (BRE-B)	LPV200_Canada	The uplink for the CRE GEO, GEO 138, switched from the Brewster-B uplink site to the Woodbine uplink site at 8:01:27 GMT. This caused a 4 second outage of the GEO 138 broadcast and also caused the WAAS carrier smoothing algorithm to reinitialize from PRN138. This also caused the UDRE for GEO 138 to be elevated. The elevated UDREs caused minor degradation of LPV200 service coverage in Canada from 10:05 GMT to 10:14 GMT, and from 12:22 GMT to 12:30 GMT. TOW 115304-115309
10/17/2016	10/17/2016	PRN135	LPV200_CONUS	A missed maneuver caused PRN 135 to alert to not monitored from 13:04:34 GMT to 14:25:37 GMT. The elevated UDRE for PRN 135 caused moderate degradation of LPV200 service coverage in CONUS from 14:07 GMT to 14:13 GMT. TOW 133491-138354 Please see plot(s): <a href="#">LPV200_10/17/2016</a>

<b>Start Date</b>	<b>End Date</b>	<b>Location/Satellites</b>	<b>Service Affected</b>	<b>Event Description</b>
10/25/2016	10/25/2016	Washington D.C. (CnV), Los Angeles (CnV), Atlanta (CnV)	LPV200_Alaska, LPV200_Canada	Geomagnetic activity (Kp = 7) disturbed the ionosphere causing elevated GIVE values. This resulted in minor degradation of: (1) LPV200 service coverage in Alaska from 10:39 GMT to 11:07 GMT and from 15:26 GMT to 15:34 GMT; and (2) LPV200 service coverage in Canada from 01:52 GMT to 02:06 GMT, from 11:42 GMT to 11:58 GMT, and from 22:40 GMT to 23:02 GMT. Please see plot(s): <a href="#">LPV200_10/25/2016</a> <a href="#">Cov vs Time Alaska 10/25/2016</a>
10/26/2016	10/26/2016	Washington D.C. (CnV), Los Angeles (CnV), Atlanta (CnV)	LPV200_Canada	Geomagnetic activity (Kp = 6) disturbed the ionosphere causing elevated GIVE values. this resulted in minor degradation of the LPV200 service coverage in Canada from about from 02:41 GMT to 02:48 GMT, from 16:49 GMT to 17:07 GMT, from 17:49 GMT to 18:09 GMT, from 19:59 GMT to 20:19 GMT and from 22:53 GMT to 23:02 GMT. Please see plot(s): <a href="#">LPV200_10/26/2016</a> <a href="#">Cov vs Time Alaska 10/26/2016</a>
10/27/2016	10/27/2016	Washington D.C. (CnV), Los Angeles (CnV), Atlanta (CnV)	LPV200_Canada	Several IGPs from latitudes 70 to 75 and longitudes -90 to -50 were set to Not-Monitored from 15:50 GMT to 16:34 GMT and from 17:45 GMT to 17:50 GMT. The WAAS performance monitor reported at the time IGPs were set to Not-Monitored state that the Iqaluit WRS experience sub-frame reasonability warning and YFB PID Down fault which removed Iqaluit WRS from the WAAS correction processing. The Not-Monitored IGPs caused minor degradation to LPV200 service coverage in Canada from 15:50 GMT until 16:43 GMT. Please see plot(s): <a href="#">LPV200_10/27/2016</a> <a href="#">Cov vs Time Canada 10/27/2016</a>
11/9/2016	11/9/2016	GEO135,Littleton (APA)	LPV200_CONUS, LPV200_Alaska	The uplink for the CRW GEO, GEO 135, switched from the Littleton uplink site to the Napa uplink site at 8:00:28 GMT. This caused a 4 second outage of the GEO 135 broadcast and also caused the WAAS carrier smoothing algorithm to reinitialize for PRN135. This also caused the UDRE for GEO 135 to be elevated. The elevated UDRE for GEO 135 caused minor degradation of: (1) LPV200 service coverage in CONUS from 12:22 GMT to 12:45 GMT; and (2) LPV200 service coverage in Alaska from 09:46 GMT to 10:03 GMT. TOW 288045-288050 Please see plot(s): <a href="#">LPV200_11/9/2016</a>
11/10/2016	11/10/2016	PRN135	LPV200_CONUS	A missed maneuver caused PRN 135 to alert to “not monitored” from 11:50:07 GMT to 12:51:58 GMT. The elevated UDRE for PRN 135 caused moderate degradation of LPV200 service coverage in CONUS from 12:19 GMT to 12:30 GMT. ## 1.2 Report Overview

Section 2 provides the observed Localizer Performance with Vertical Guidance (LPV) and non-precision approach (NPA) performance for the evaluated receiver locations (see Table 1-2 and Table 1-3). This section also shows

tabulated data for the 95% accuracy and the maximum inaccuracy. In addition, the daily 95% accuracy for each receiver and the histograms of vertical and horizontal error are shown.

Section 3 provides the summary of the WAAS instantaneous availability performance at each receiver, for three operational service levels. In addition, the daily availability, number of outages, and outage rate for each evaluated receiver are also reported.

Section 4 provides geographic plots of the WAAS service availability. Also shown in this section are plots of the percentage of the Continental United States (CONUS) and Alaska service areas covered by various levels of service availability.

Section 5 provides the summary of the Hazardous Misleading Information (HMI) analysis as well as a safety margin index for each receiver. This section also shows update rates of WAAS messages transmitted from CRE, CRW, and AMR.

Section 6 provides the UDRE and GIVE bounding percentages and the 95% index of the range and ionospheric accuracy for each satellite tracked by the WAAS receiver at 12 locations.

Section 7 provides the GEO ranging performance for CRE and CRW.

Section 8 provides the WAAS LPV availability and outages at selected airports.

Section 9 provides the assessment of WAAS code noise and multipath (CNMP) bounding for 114 WAAS receivers.

Section 10 provides surveyed positions of all Wide-Area Reference Equipment (WRE) as well as the difference between the WRE survey positions and the survey positions using both the National Geodetic Survey (NGS) Online Positioning Use Server (OPUS) and the Canadian Spatial Reference System (CSRS) Precise Point Positioning (PPP) service.

Section 11 provides the daily and quarterly average of SQM PRN type biases and PRN biases.

## 2.0 WAAS POSITION ACCURACY

Navigation error data, collected from WAAS and NSTB reference stations, was processed to determine position accuracy at each location. This was accomplished by utilizing the GPS/WAAS position solution tool to compute a RTCA DO-229D weighted least squares user navigation solution, and WAAS horizontal and vertical protection levels (HPL and VPL) once every second. The user position calculated for each receiver was compared to the surveyed position of the antenna to assess position error associated with the WAAS SIS over time. The position errors were analyzed and statistics were generated for the operational service levels shown in Table 1-1.

Table 2-1 shows PA horizontal and vertical position accuracy maintained for 95% of the time at LP, LPV and LNAV/VNAV operational service levels as well as 95% SPS accuracy for certain locations. Note that WAAS accuracy statistics presented are compiled only when all WAAS corrections (i.e., fast, long term, and ionospheric corrections) for at least four satellites are available; this is referred to as PA navigation mode. Table 2-1 also shows the percentage of time PA navigation mode was supported by WAAS at each receiver. The maximum and minimum LPV errors for this reporting period are as below:

- The maximum 95% CONUS horizontal LPV error was 1.228 meters observed at Atlantic City.
- The maximum 95% CONUS vertical LPV error was 1.624 meters observed at Miami.
- The minimum 95% CONUS horizontal LPV errors was 0.634 meters observed at Salt Lake City.
- The minimum 95% CONUS vertical LPV error was 0.797 meters observed at Salt Lake City.

NPA navigation mode is when only WAAS fast and long term corrections are available to a user (i.e., no ionospheric corrections). Table 2-2 shows the 95%, 99.999%, and maximum NPA horizontal position accuracy. The maximum and minimum NPA errors for this reporting period are as below:

- The maximum 95% horizontal error was 3.217 meters observed at Honolulu.
- The maximum 99.999% horizontal error was 8.716 meters observed at Honolulu.
- The minimum 95% horizontal error was 0.871 meters observed at Barrow.
- The minimum 99.999% horizontal error was 2.358 meters observed at Bethel.

Table 2-3 shows the quarterly maximum LPV error statistics: (1) the column Horizontal Error column shows the maximum position errors while the calculated HPL meets the LPV service level defined in Table 1-1, (2) the Vertical Error column shows the maximum position errors while the calculated VPL meets the LPV service level, (3) the Horizontal Error/HPL column and the Vertical Error/VPL column show the ratio of position error to protection level at the time the maximum error occurred, (4) the Horizontal Maximum Ratio column and the Vertical Maximum Ratio column show the maximum position error to protection level ratio for the quarter. During this reporting period, the maximum LPV horizontal error was 3.628 meters occurred at Iqaluit and maximum vertical LPV error was 5.730 meters occurred at Barrow.

Figures 2-1 through 2-3 show the daily LPV 95% horizontal accuracy at the PA evaluation sites, and Figures 2-4 through 2-6 show the daily LPV 95% vertical accuracy. Noteworthy increases in the 95% PA position errors over multiple evaluation sites due to geomagnetic activity in Figures 2-1 through 2-6 are listed below.

- October 13, 2016—Position errors in CONUS, Alaska, Canada, and Mexico were elevated. The maximum 95% horizontal and vertical LPV errors were 1.414 meters and 2.779 meters at Iqaluit and Mexico City, respectively. The Kp index range was 6.
- October 25, 2016—Position errors in Alaska and Canada were elevated. The maximum 95% horizontal and vertical LPV errors were 1.064 meters and 1.684 meters at Iqaluit. The Kp index was 7.
- November 10-11, 2016—Position errors in CONUS, Alaska, Canada, and Mexico City were elevated. The maximum 95% horizontal and vertical LPV errors were 1.644 meters and 2.901 meters at Atlantic City and Mexico City, respectively. The Kp index was 4 and 5.
- December 8-9, 2016—Position errors in CONUS, Canada, and Mexico were elevated. The maximum 95% horizontal and vertical LPV errors were 1.583 meters and 3.318 meters at Atlantic City and Mexico City, respectively. The Kp index was 4 and 5.

Figures 2-7 and 2-8 show the daily NPA 95% horizontal accuracy at the NPA evaluation sites for the reporting period. The increases in 95% NPA position errors due to geomagnetic activity occurred on October 2, 13, and 25; November 10-11 and 24-25; and December 8-9 and 23.

Figure 2-9 through Figure 2-12 show the distributions of the vertical and horizontal errors at all 38 WAAS receiver for the quarter. Figure 2-9 and Figure 2-10 show the triangular distributions of VPE versus VPL and HPE versus HPL: (1) the horizontal axis is the position error, (2) the vertical axis is the WAAS protection level where lower protection levels equate to better availability, (3) the diagonal line shows the point where error equals protection level, (4) above and to the left of the diagonal line show where errors are bounded (WAAS is providing integrity in the position domain), and (5) below and to the right show where errors are not bounded (HMI could be present). Figure 2-11 and Figure 2-12 show the 2D histograms of HPE, VPE, and normalized position errors: (1) the blue trace shows the distributions of the actual HPE and VPE; (2) the horizontal axis is the position errors and the vertical axis is the total count of data samples (log scale) in each 0.1-meter bin; (3) the magenta trace shows the distributions of the actual horizontal and vertical errors normalized by one-sigma value of the protection level: horizontal - (HPL/6.0) and vertical - (VPL/5.33); (4) the horizontal axis is the standard units and vertical axis is the observed distribution of normalized errors data samples in each 0.1-sigma bin. The narrowness of the normalized error distributions indicates good safety performance.

### 3.0 AVAILABILITY

The WAAS availability evaluation documents the percentage of time the WAAS provided service for the operational service levels defined in Table 1-1. The RTCA DO-229D VPL and HPL were computed for each evaluated receiver. Table 3-1 shows the evaluated receivers, the 99% maintained protection levels, and the percentage in PA mode (described in Section 2). The maximum and minimum VPL and HPL for this reporting period are listed as below:

- The maximum 99% CONUS HPL was 15.866 meters observed at Arcata
- The maximum 99% CONUS VPL was 31.779 meters observed at Oakland
- The minimum 99% CONUS HPL was 10.82 meters observed at Denver
- The minimum 99% CONUS VPL was 18.924 meters observed at Kansas City
- The maximum 99% Alaska HPL was 20.228 meters observed at Cold Bay
- The maximum 99% Alaska VPL was 34.234 meters observed at Barrow
- The minimum 99% Alaska HPL was 13.155 meters observed at Juneau
- The minimum 99% Alaska VPL was 22.393 meters observed at Juneau

Availability of LP, LPV, and LPV200 services are evaluated by monitoring the WAAS protection levels at receiver locations. Service is available when the VPL is less than the vertical alert limit (VAL) and the HPL is less than the horizontal alert limit (HAL). When the protection level exceeds the alert limit, the service is unavailable and an outage in service is recorded along with its duration. The operational service is not available again until both protection levels are within the alert limits for at least 15 minutes. Although this will cause minimal reduction in operational service availability, it will substantially reduce the number of service outages and prevent excessive switching in/out of service availability.

Table 3-2 shows the percentage of time LP, LPV, and LPV200 service is available using the 15-minute window criteria. Table 3-4 shows LP, LPV, and LPV200 service outages and associated outage rates. The outage rate is the percentage of theoretically interrupted approaches through a loss of operational service once the approach had started. Figure 3-1 through Figure 3-6 show the daily availability of LPV and LPV200 service levels. Figure 3-7 through Figure 3-12 show the daily interruptions of LPV and LPV200 service levels.

Availability of NPA service is evaluated by monitoring the WAAS HPL at receiver locations. Service is available when the HPL is less than HAL of 556 meters. The service is unavailable when HPL exceeds the HAL or when WAAS navigation message is not received, and the service outage and its duration are recorded. NPA service is not available again until the HPL is within the HAL for at least 15 minutes. Table 3-3 shows the percentage of time that NPA service is available using the 15-minute window criteria. Table 3-5 shows the NPA service outages and associated outage rates. The outage rate is the percentage of theoretically interrupted NPA approaches through a loss of operational service once the approach had started.

The availability decreases for this quarter were due to satellite outages, geomagnetic activity, communication outages, radio frequency interference (RFI), and elevated UDRE and GIVE values. Noteworthy events that affected availability are listed below.

- October 7 – Local RFI at Boston caused a reduction and eventual loss of space vehicle (SV) tracking. The outage occurred from 17:32 GMT to 17:33 GMT
- October 12 – Local RFI at Miami caused a reduction and eventual loss of SV tracking. The outage occurred from 16:13 GMT to 16:14 GMT
- October 13 – Geomagnetic activity caused elevated GIVE values, which reduced LPV200 availability in Alaska and Canada.
- October 17 – A GUS Switchover on CRE caused a reduction in LPV200 availability in Canada.
- October 19 – Local RFI at Miami caused a reduction and eventual loss of SV tracking. The outage occurred from 15:32 GMT to 15:33 GMT

- October 20 – Local RFI at Miami caused a reduction and eventual loss of SV tracking. The outage occurred from 14:31 GMT to 14:32 GMT
- October 27 – Several IGPs were set to Not-Monitored from 15:50 GMT to 16:34 GMT and from 17:45 GMT to 17:50 GMT. At that time, Iqaluit experienced a sub-frame reasonability warning which removed it from WAAS correction Processing. This caused a reduction in LPV200 availability in Canada.
- November 9 – A GUS Switchover on CRW caused a reduction in LPV200 availability in Alaska and Canada
- November 10 – A missed maneuver caused an alert to Not-Monitored and raised UDRE on PRN 135 causing a reduction in LPV200 availability in CONUS
- November 22 – Local RFI at Miami caused a reduction and eventual loss of SV tracking. The outage occurred from 18:18 GMT to 18:20 GMT
- November 22 – Local RFI at Boston caused a reduction and eventual loss of SV tracking. The outage occurred from 18:58 GMT to 18:59 GMT
- November 26 – A GUS Switchover on CRW caused a reduction in LPV and LPV200 availability in Alaska
- November 30 – Local RFI at Miami caused a reduction and eventual loss of SV tracking. The outage occurred from 19:01 GMT to 19:02 GMT
- December 3 – Local RFI at New York caused a reduction and eventual loss of SV tracking. The outage occurred from 12:42 GMT to 12:47 GMT
- December 9 – Local RFI at New York caused a reduction and eventual loss of SV tracking. The outage occurred from 02:54 GMT to 02:56 GMT
- December 12-14 – Satellite Maintenance caused elevated UDREs on PRN-11 and reduced LPV200 availability in Alaska and Canada on December 13<sup>th</sup>

#### 4.0 COVERAGE

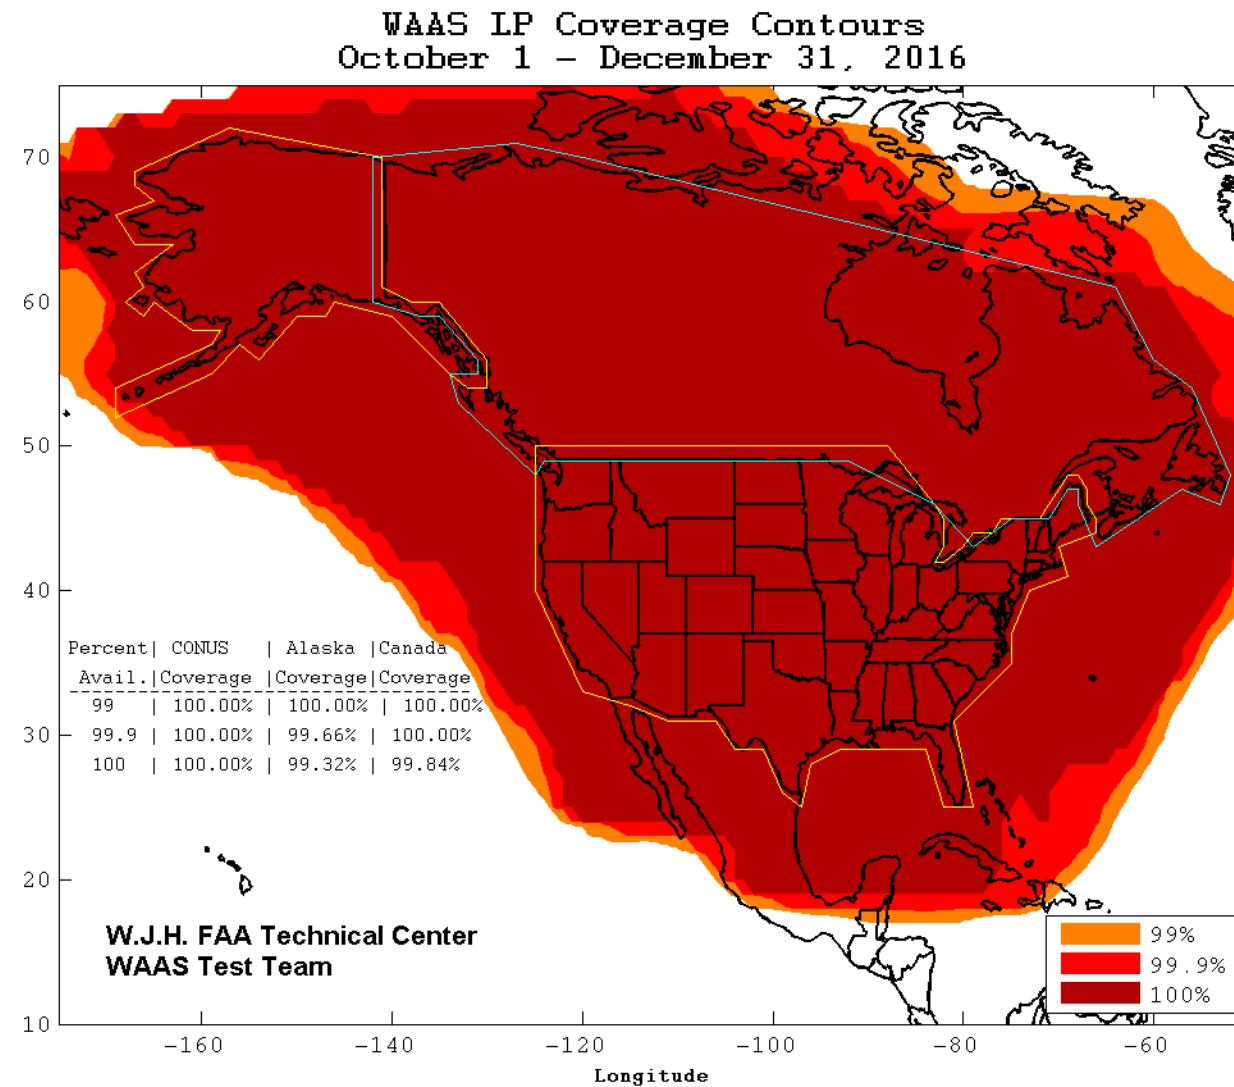

The WAAS coverage area evaluation estimates the percent of service volume where WAAS provided service for the operational service levels defined in Table 1-1. The WAAS message and GPS/GEO satellite status are used to determine WAAS availability across North America. For PA coverage, protection levels were calculated at 30-second intervals at one-degree spacing over the PA service volume, while for NPA coverage, the protection levels were calculated at 30-second intervals at five-degree spacing over the NPA service volume.

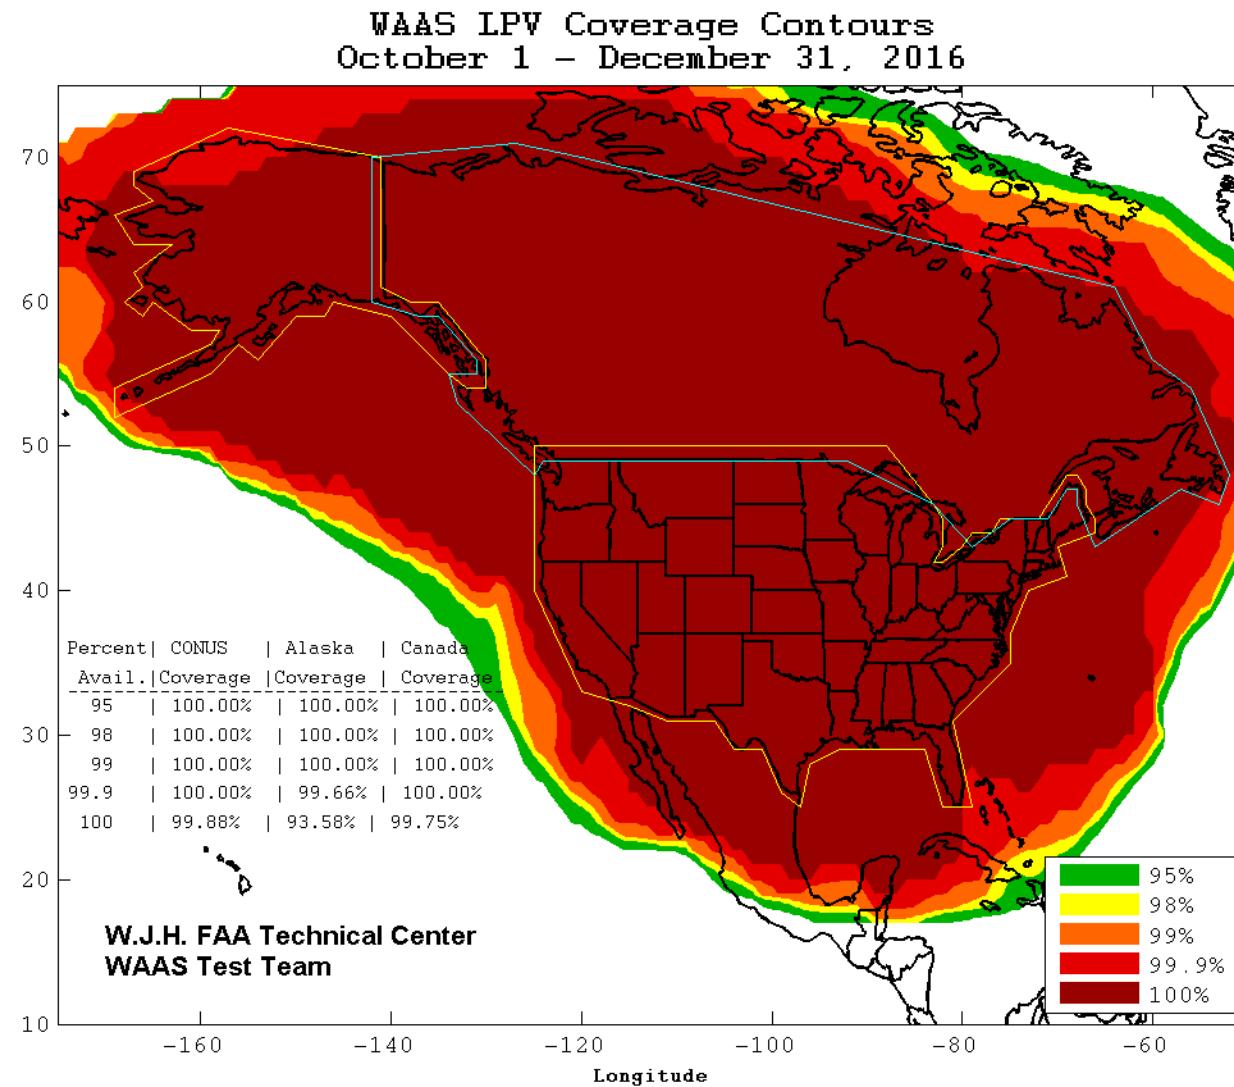

Daily PA analysis was conducted for LP, LPV, and LPV200 service levels. The PA coverage plots provide 100, 99.9, 99, 98, and 95% availability contours. Figure 4-1 shows the rollup LP North America coverage, Figure 4-2 shows the rollup LPV North America coverage, Figure 4-3 shows the rollup LPV200 North America coverage, Figure 4-6 shows the daily LPV and LPV200 CONUS coverage, Figure 4-7 shows the daily LPV Alaska coverage at 99% availability and ionosphere Kp index values, and Figure 4-8 shows the daily LPV and LPV200 Canada coverage at 99% availability and ionosphere Kp index values. See Appendix B for coverage plots of 98% LP and LPV availability contour, and 99% LPV200 availability contour. Kp quantifies the disturbance in the Earth's magnetic field and is an indicator of solar storms causing geomagnetic disturbances, which can cause an unpredictable ionosphere. When the WAAS detects a disturbed ionosphere, it increases GIVE values that may result in unavailable PA service.

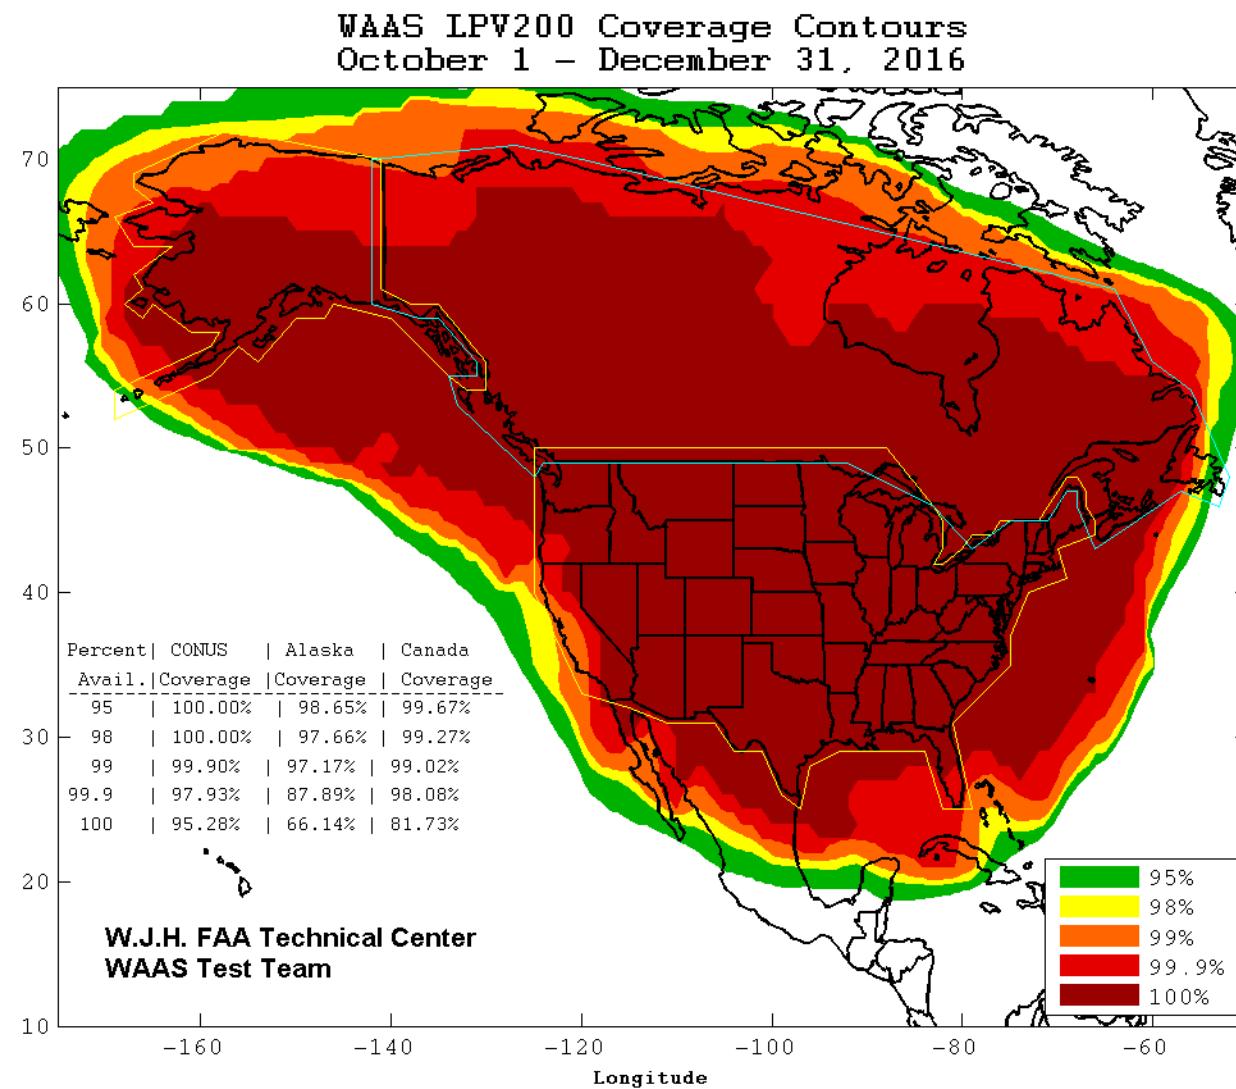

Daily analysis for NPA was conducted for the Required Navigation Performance (RNP) 0.1 and RNP 0.3 service levels based on a 100% availability requirement. The NPA coverage plots provide 100, 99.9, and 99% availability contours. Figure 4-4 shows the rollup RNP 0.1 coverage and Figure 4-5 shows the rollup RNP 0.3 coverage for the quarter. Figure 4-9 shows the daily RNP coverage at 100% availability and ionosphere Kp index values for this quarter.

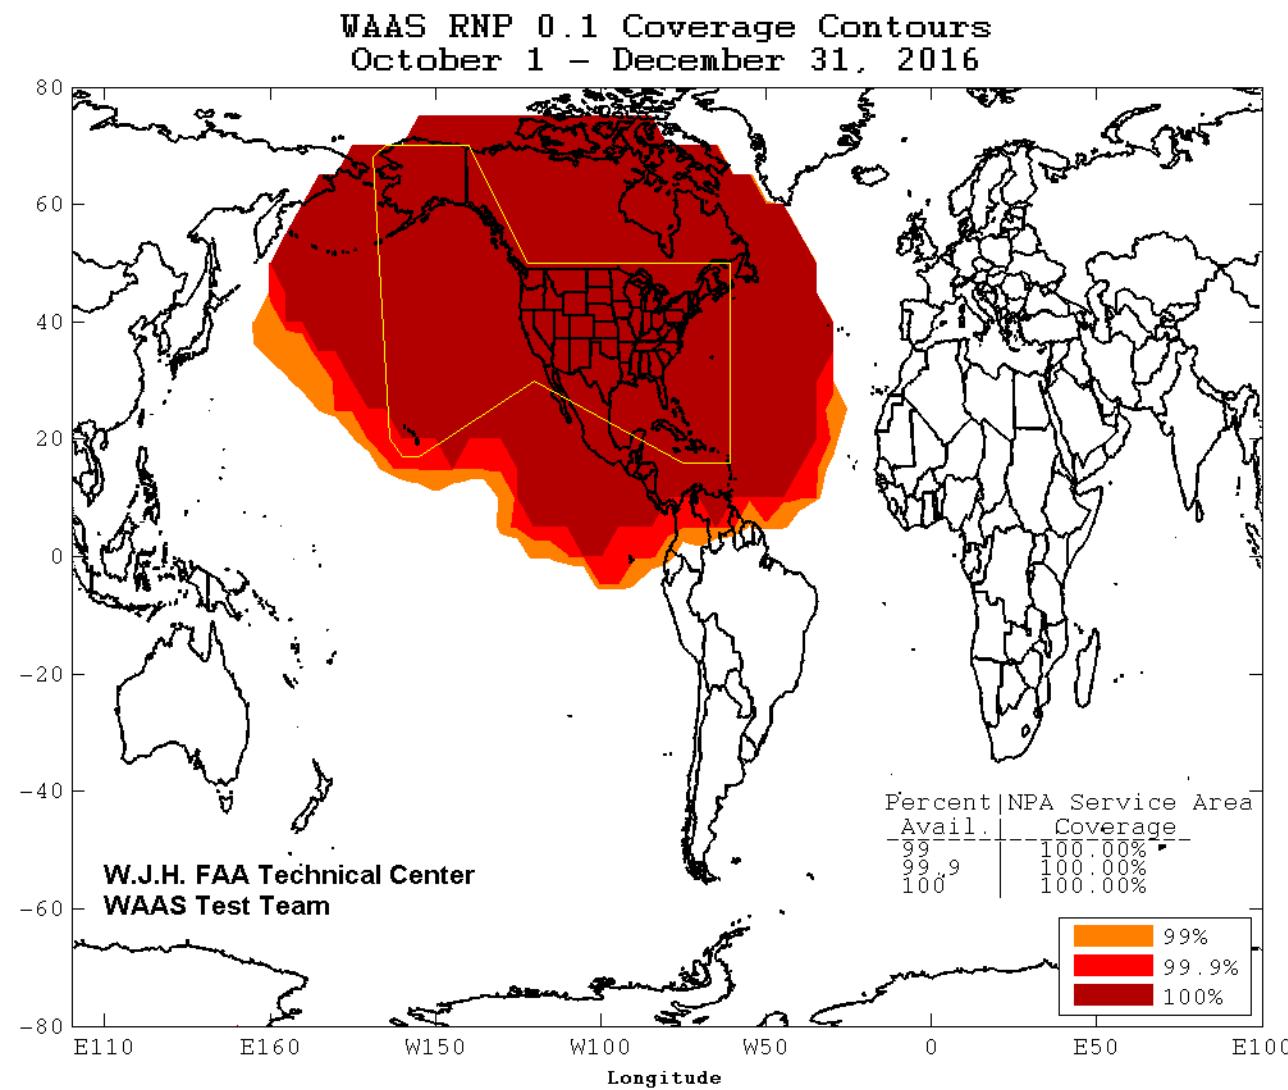

The coverage decreases for this quarter were due to satellite outages, geomagnetic activity, communication outages, and elevated UDRE and GIVE values. Noteworthy events that affected coverage are listed below.

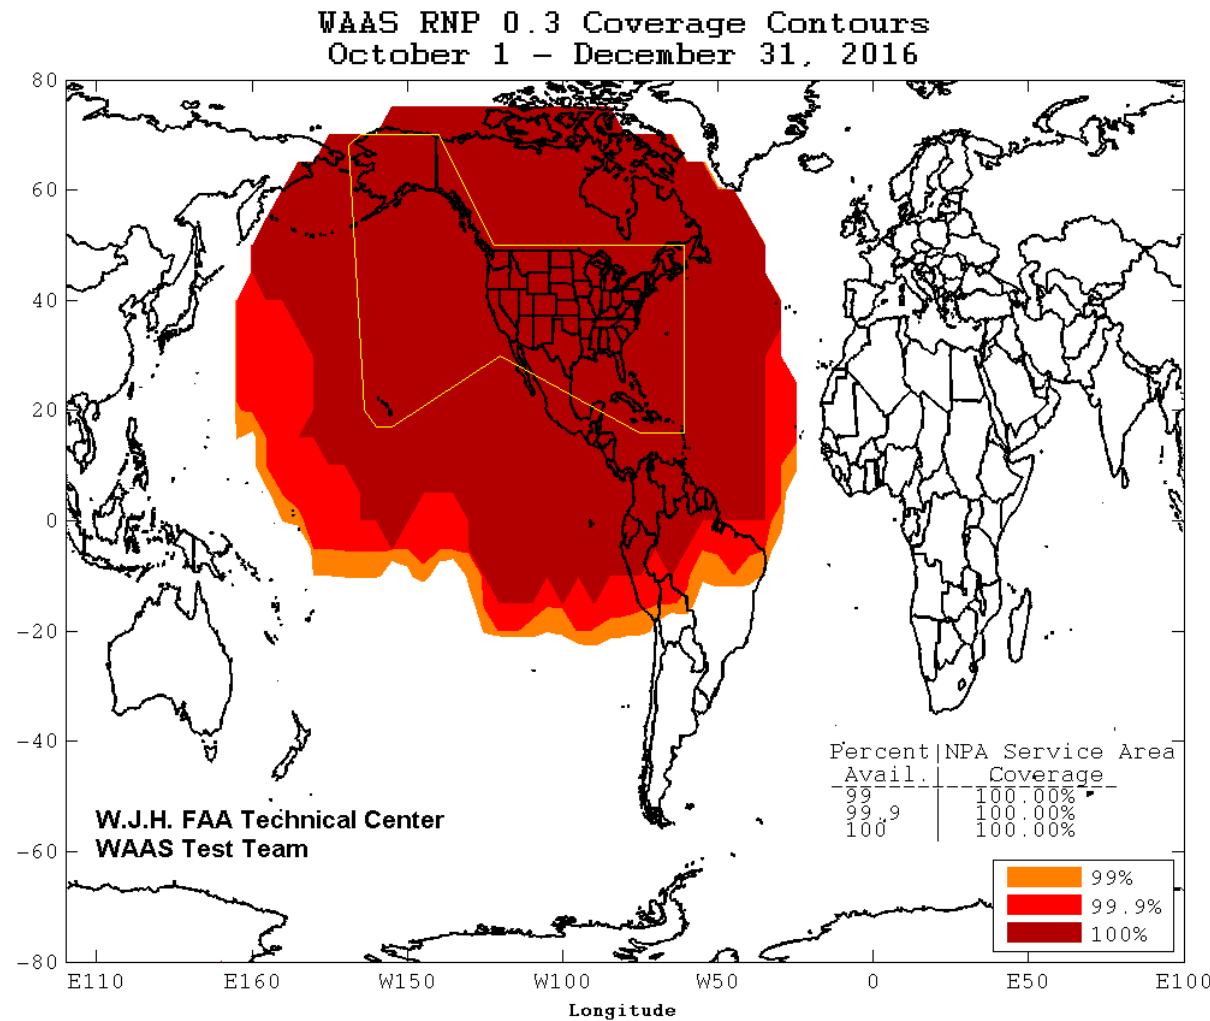

- October 13 – Geomagnetic activity caused elevated GIVE values, which reduced LPV200 coverage in Alaska and Canada.
- October 17 – A GUS Switchover on CRE caused a reduction in LPV200 coverage in Canada.
- October 27 – Several IGPs were set to Not-Monitored from 15:50 GMT to 16:34 GMT and from 17:45 GMT to 17:50 GMT. At that time, Iqaluit experienced a sub-frame reasonability warning which removed it from WAAS correction Processing. This caused a reduction in LPV200 coverage in Canada.
- November 9 – A GUS Switchover on CRW caused a reduction in LPV200 coverage in Alaska and Canada
- November 10 – A missed maneuver caused an alert to Not-Monitored and raised UDRE on PRN 135 causing a reduction in LPV200 coverage in CONUS
- November 26 – A GUS Switchover on CRW caused a reduction in LPV and LPV200 coverage in Alaska
- December 12-14 – Satellite Maintenance caused elevated UDREs on PRN-11 and reduced LPV200 coverage in Alaska and Canada on December 13<sup>th</sup>

## 5.0 INTEGRITY

### 5.1 HMI Analysis

Integrity analysis includes the identification and evaluation of HMI as well as the generation of the safety index to illustrate the safety margin provided by WAAS protection levels. The safety index is a metric that shows how well the protection levels are bounding the maximum observed error when LPV service is available. The horizontal and vertical safety margin index is the ratio of HPL/HPE and VPL/VPE, respectively, at the time the maximum position error occurred. Section 2.0 provides a detailed description of the methodology for computing HPL, VPL, and position errors.

A computed safety margin index of greater than one indicates safe bounding of the greatest observed error, less than one indicates that the maximum error was not bounded, and a result equal to one means that the maximum position error was equal to the protection level. An HMI event occurs if the position error exceeds the protection level in the vertical or horizontal dimensions at any time and, coupled with the passage of 6.2 seconds before this event is corrected by WAAS.

Figure 5-1 lists the safety margin index and the number of HMI events. For this reporting period, the lowest safety margin index is 3.97 at Anchorage and there were no HMI events. There has not been an HMI event since WAAS was made available to the public in August 2000. In July 2003, WAAS was commissioned by the FAA for safety of life services.

**Table 5-1 Minimum Safety Margin Index and HMI Statistics**

Location	Safety Index		Number of HMIs

Winnipeg	9.09	5.17	0

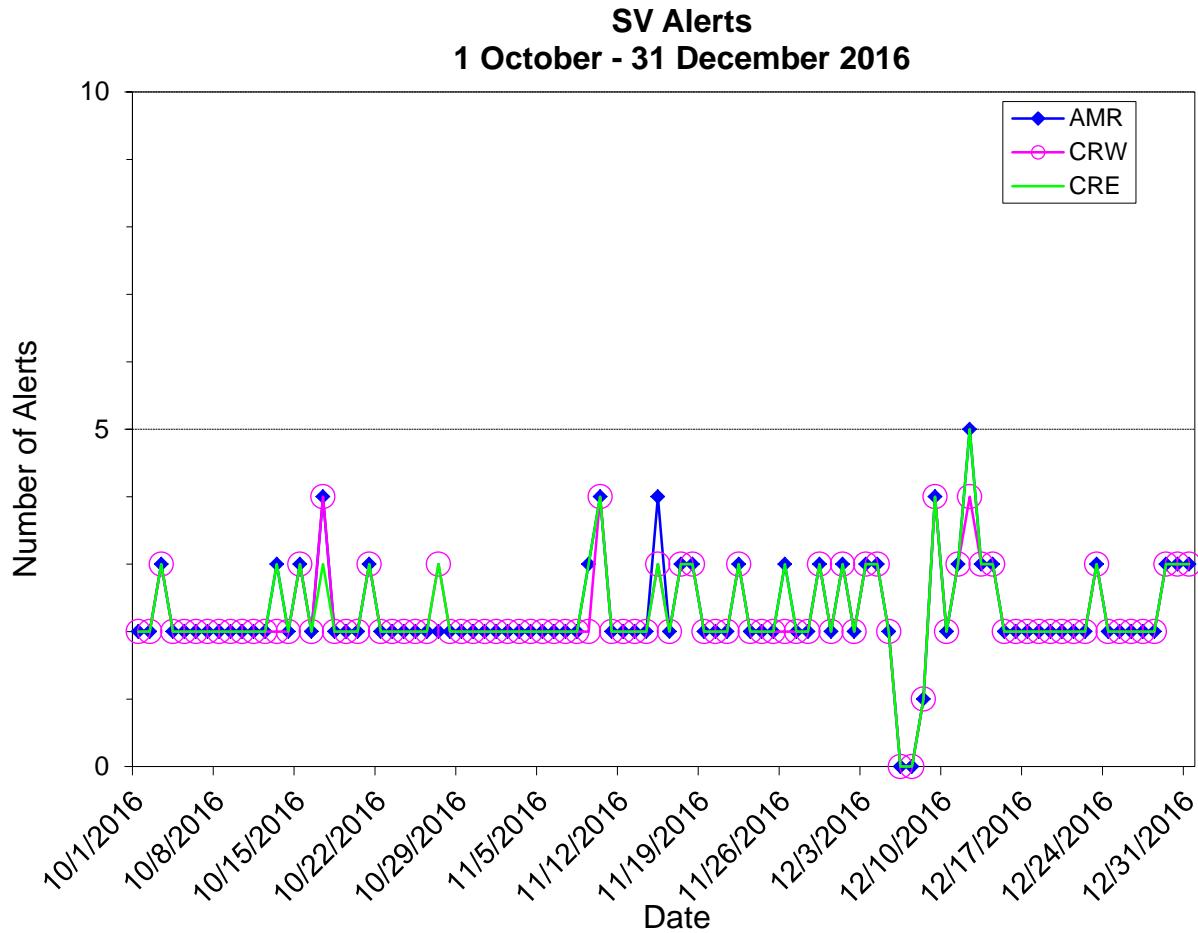

## 5.2 Broadcast Alerts

The WAAS transmits alert messages for user protection when the active WAAS corrections are no longer bound by the UDREs. Alerts increase the UDRE for one or more PRNs, which can reduce the weighting of the satellite or exclude the satellite from the navigation solution. An increase in UDREs after an alert effectively increases the user protection levels (HPL and VPL), which affects the availability. Additionally, if an alert message sequence lasts for more than 12 seconds, the WAAS fast corrections can time out and cause a loss of continuity. Table 5-2 shows the total number of alerts and the average number of alerts per day.

Figure 5-1 provides the daily SV alerts. The number of alerts on one GEO is often the same as the number of alerts on the other GEO, therefore, lines tend to overlap in most points on this plot. CRE C&V source select to ZTL after SSM 45 upgrade caused CRE re-initialization and elevated PRN-135 and PRN-138 UDREs reported by CRE

### 5.3 Availability of WAAS Messages (CRE, CRW, and AMR)

Accurate and current calculations of user position are dependent upon the broadcast and receipt of the WAAS message within precise time specifications. This aspect of the WAAS is critical to maintaining continuity requirements. Each message type in the WAAS SIS has a specific timeout interval and expected worst-case broadcast interval. Table 5-3 lists the maximum intervals at which each message must broadcast to meet system requirements.

GUS switchovers and broadcast WAAS alerts can interrupt the normal broadcast message stream. If these events occur when the maximum interval of a specific message is approaching, that message may be delayed, resulting in its late transmittal.

For this quarter, statistics reported for late messages were mainly caused by GEO SIS outages, GUS switchovers, and SV alerts; excluding message type 7 and 10. Furthermore, the delay of message types 7 and 10 had little or no impact on user performance and safety, and were not caused by GEO SIS outages, GUS switchovers, or SV alerts.

Table 5-4 through Table 5-8 show statistics for fast correction, long correction, ephemeris covariance, ionosphere correction, and ionospheric mask message rates broadcasted on AMR GEO. Table 5-9 through Table 5-13 show statistics for message rates broadcasted on CRW GEO. Table 5-14 through Table 5-18 show statistics for message rates broadcasted on CRE GEO.

#### 5.4 Satellite Glitches

The GPS satellites will occasionally experience periods of signal carrier stability glitches of varying magnitude. These glitches are short degradations in the signal, which in severe cases may cause WAAS to lose track or cycle slip for some or all of the WAAS receivers. The more severe glitches will cause the WAAS reported UDRE to increase to ‘Not Monitor’ and result in an alert.

Figure 5-2 shows the satellite glitches visible to WAAS during the quarter. Glitches are categorized into three severity levels: (1) Severity One glitches cause a significant number of the receivers to simultaneously report bad subframe parity, (2) Severity Two glitches cause all of the receivers to report bad subframe parity data and some receivers to also have cycle slips and/or lose tracking of L2 and/or L1, and (3) Severity Three glitches cause all of the receivers to lose track of both L1 and L2 data. Note, the tool used to perform this Satellite Glitch Analysis also reports times when more than 14 GPS satellites are in view for some of the WAAS reference stations. The NovAtel WAAS G3 receiver is only capable of tracking 14 GPS satellites at a given time, and GPS users may also experience this condition.

**Figure 5-2 SV Glitch Trend**

## 6.0 SV RANGE ACCURACY

Range accuracy evaluation computes the probability that the WAAS UDRE and GIVE statistically bound 99.9% of the range residuals for each satellite tracked by the receiver. A UDRE is broadcasted by the WAAS for each monitored satellite and the 99.9% bound (3.29 sigma) of the pseudorange residual error after application of fast and long-term corrections is checked. The pseudorange residual error is determined by taking the difference between the raw pseudorange and a calculated reference range. The reference range is equal to the true range between the corrected satellite position and surveyed user antenna plus all corrections (i.e., WAAS fast clock, WAAS long-term clock, WAAS ionospheric delay, tropospheric delay, receiver clock bias, and multipath). Because the true ionospheric delay and multipath error are not precisely known, the estimated variance in these error sources are added to the UDRE before comparing it to the residual error.

The GPS satellite range residual errors were calculated for 12 WAAS receivers during the quarter. Table 6-1 and Table 6-2 show the range error 95% index and 99.9% bounding statistics for each SV at the selected locations. Figure 6-1 and Figure 6-2 show the 95% range error for each SV measured by the WAAS receivers at the Chicago reference station.

A GIVE is broadcasted by the WAAS for each monitored ionospheric grid point (IGP) and the 99.9% bound of the ionospheric error is checked. The WAAS broadcasts the ionospheric model using IGPs at predefined geographic locations. Each IGP contains the vertical ionospheric delay and the delay error in the form of the GIVE. The ionospheric error is determined by taking the difference between the WAAS vertical ionospheric delay interpolated from the IGP and GPS dual frequency measurement at that GPS satellite.

The GPS satellite ionospheric errors were calculated for 12 WAAS receivers during the quarter. Table 6-3 and Table 6-4 show the ionospheric error 95% index and 99.9% bounding statistics for each SV at the selected locations. Figure 6-3 and Figure 6-4 show the 95% ionospheric error for each SV measured by the WAAS receiver at the Chicago reference station.

For this reporting period, most satellite range errors were bounded at least 99.9% of the time by UDRE. Other unbounded errors (i.e., errors bounded less than 100% of the time) were due to geomagnetic activity, noise, and/or multipath. PRN-4 was unavailable for the quarter.

## **7.0 GEO RANGING PERFORMANCE**

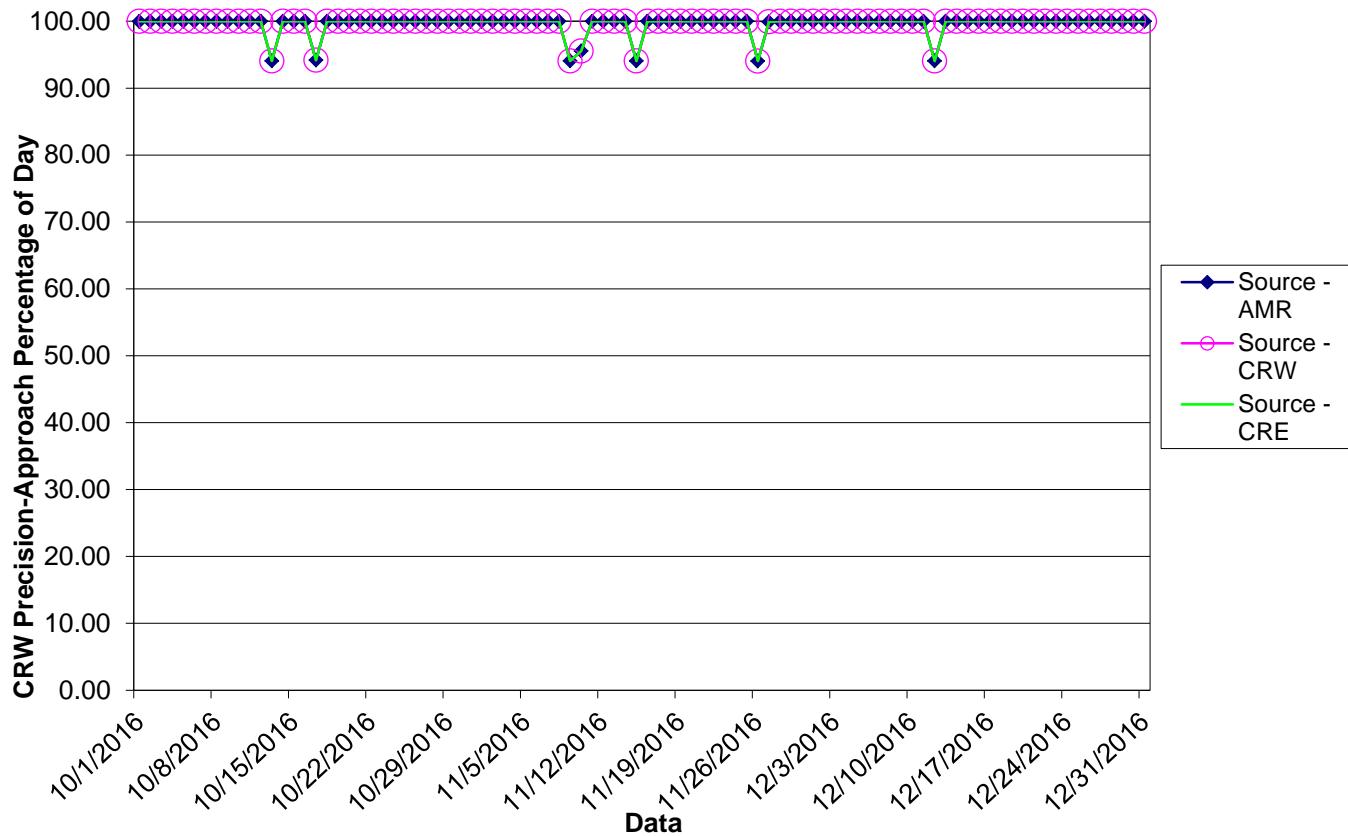

The WAAS GEO navigation messages provide corrections and UDRE values for each satellite. The GEO ranging availability from each GEO navigation message source was evaluated separately to determine the quality of service provided.

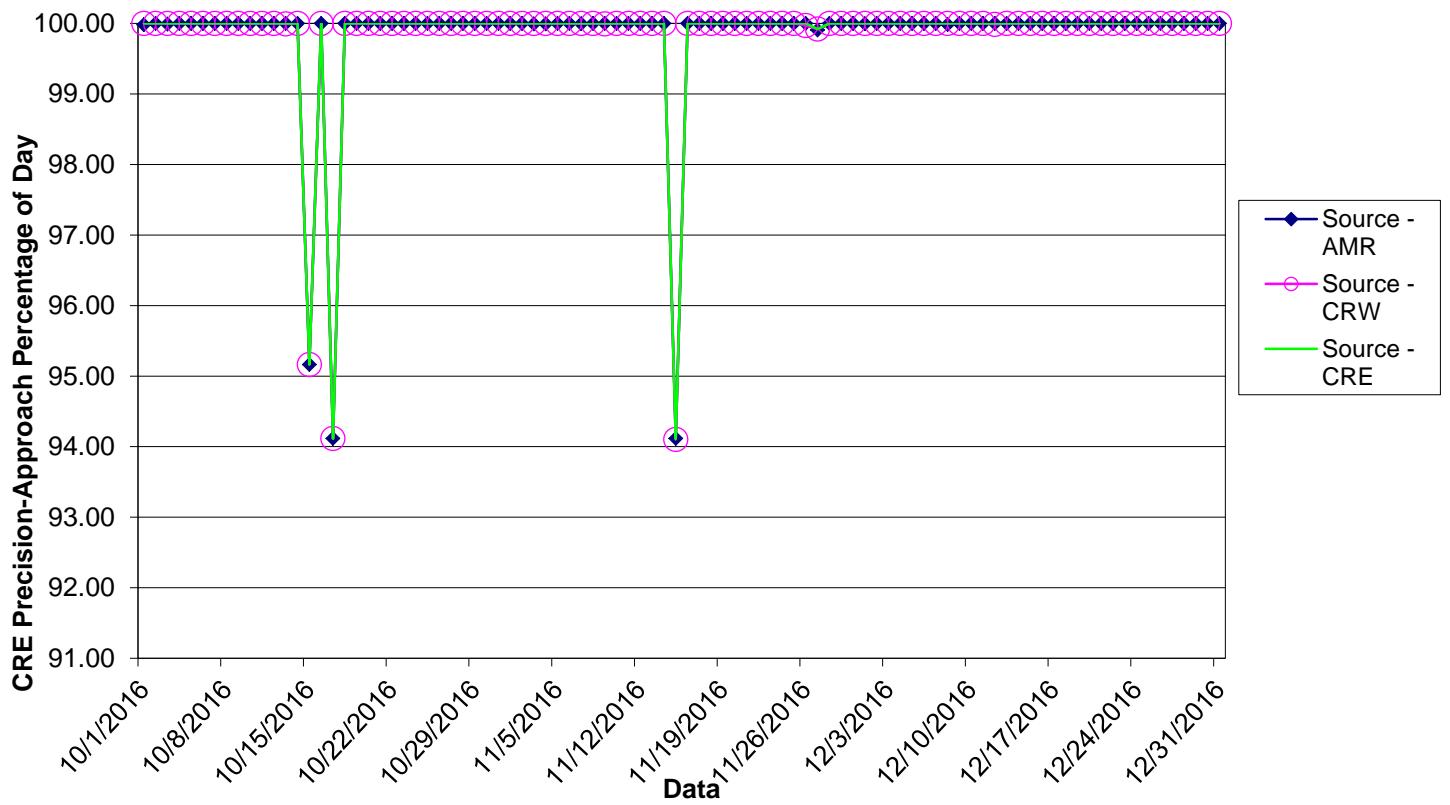

Table 7-1 shows the GEO PA and NPA ranging availability as well as the percentage of time the GEO UDRE was set to “Not Monitored” and “Do Not Use.” Figure 7-1 and Figure 7-2 show the trend of CRW GEO PA and CRE GEO PA ranging availability, respectively. Figure 7-3 shows the trend of AMR GEO NPA ranging availability.

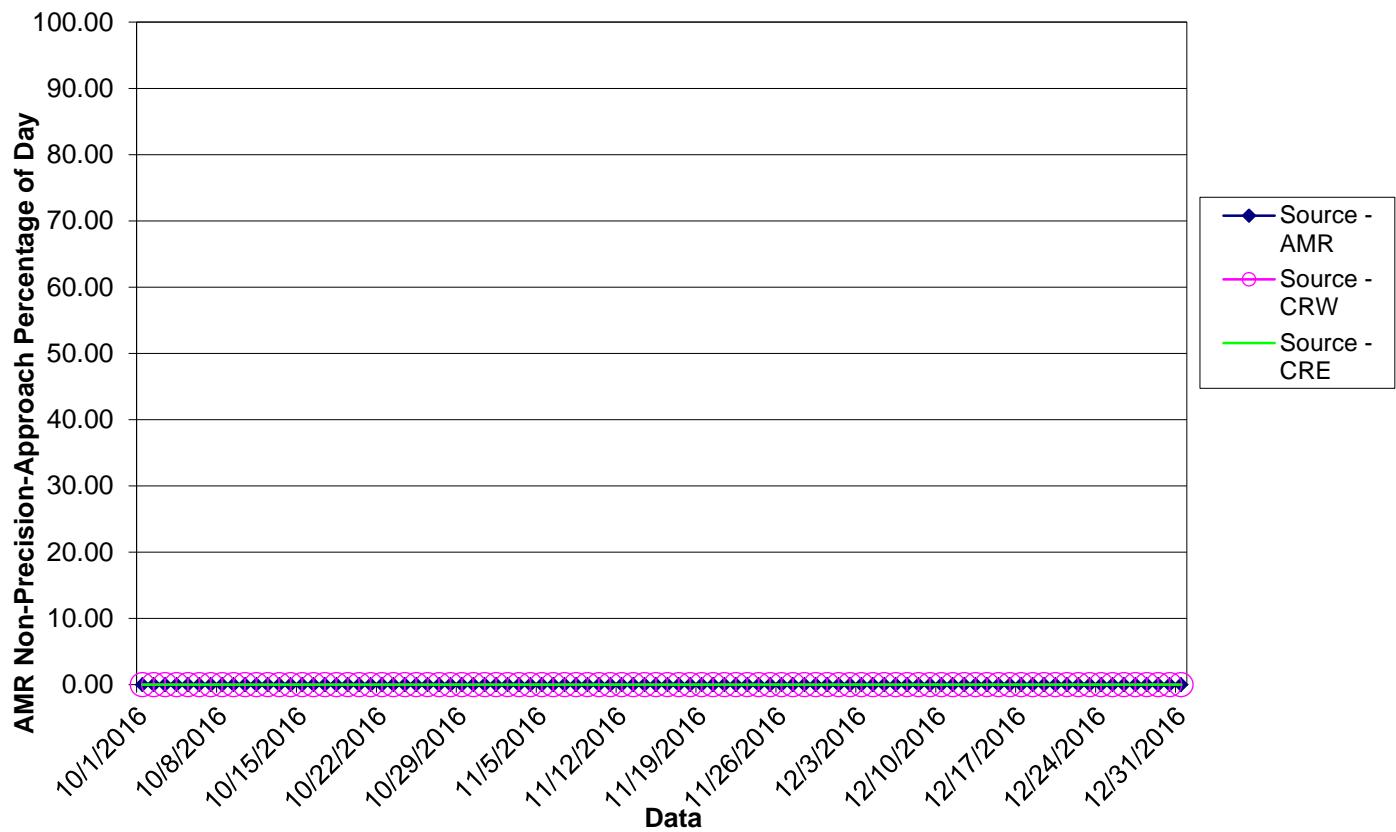

The reductions in CRW GEO PA and CRE GEO PA ranging availability were due to GUS switchovers (see Figure 7-1 and Figure 7-2). Refer to Table 1-7 for detailed information on the GUS switchovers for this reporting period. Figure 7-3 shows AMR GEO NPA ranging was unavailable for this quarter. On July 18, 2015, the UDRE for AMR was indefinitely set to “Not Monitored,” which meant users can use WAAS corrections without the ranging capabilities.

**Table 7-1 GEO Ranging Availability**

GEO Source	GEO	PA (%)	NPA (%)	Not Monitored (%)	Do Not Use (%)
CRW 135	CRW	99.57	0.06	0.27	0.11

## **8.0 WAAS AIRPORT AVAILABILITY**

The WAAS airport availability evaluation determines the number and length of LPV service outages at selected airports using the transmitted WAAS navigation message. The navigation messages transmitted from all GEO satellites are processed simultaneously, and WAAS protection levels (VPL and HPL) are computed at each airport once every 30 seconds in accordance with the RTCA DO-229D. The WAAS LPV service is available for a user when the VPL is less than or equal to the VAL of 50 meters and the HPL is less than or equal to the HAL of 40 meters. If both conditions are met, WAAS LPV service is available at that airport. Consequently, if either one of the conditions are not met the WAAS LPV service outage and its duration is recorded.

When the LPV service becomes unavailable, it is not considered available again until protection levels are below or equal to alert limits for at least 15 minutes. Although this will minimally reduce LPV service availability, it substantially reduces the number of service outages and prevents excessive switching in and out of service availability. Similar service analyses are computed for the LP and LPV200 services in accordance with HAL and VAL shown in Table 1-1. Table 8-1 shows the WAAS LPV service availability and outages at selected airports in the US and Canada. Figure 8-1 through Figure 8-6 provide graphical representation of the LP, LPV, and LPV200 availability and outage counts at airports in the US and Canada that have published GPS RNAV Instrument Approach Procedures (IAPs). These results are geographically depicted on an interactive web page and are accessible at <http://www.nstb.tc.faa.gov/AirportOutages/>.

The interactive web page can be accessed by entering the web address into an Internet browser, selecting the current quarter from the drop-down menu on the upper left corner, and clicking “Submit Request”. The WAAS LPV airport layer will appear providing color-coded availability results, as shown in Figure 8-1 and Figure 8-2. Rolling the cursor over any airport will display the LPV availability and outages for the reporting period. The “WAAS Layer” menu in the upper right of the display allows the user to select WAAS LP or LPV200 availability and outage results, as shown in Figure 8-3 through Figure 8-6. Selecting “Show all Airports” display WAAS availability for US airports with GPS RNAV IAPs; not selecting “Show all Airports” display only airports with approved LPV approaches are displayed, as shown in Table 8-1.

## 9.0 WAAS CODE NOISE AND MULTIPATH BOUNDING ANALYSIS

The purpose of the WAAS CNMP Bounding Analysis is to evaluate the performance of the CNMP algorithm and identify any undetected anomalous events in order to limit exposure to faulted receivers and persistent large multipath errors. The identification of undetected anomalous events ensures that the probability of more than one WRS producing persistent unbounded measurement errors is negligible. This offline analysis is critical to ensure that CNMP bounding is not invalidated by changes in WRE environmental conditions.

The operational CNMP functionality resides in the WAAS safety processor. The CNMP algorithm estimates, and corrects for, observed code noise and multipath and provides confidence estimates for residual error in multipath-corrected pseudorange measurements. These confidence terms provide a conservative Gaussian overbound of the true error distribution, which integrity monitors use in the weighting of the measurements.

The measurement data from the offline analysis is post-processed to estimate the carrier phase ambiguity of each entire arc of measurements for each satellite pass. The ambiguity estimate is used to level the carrier measurement, which is then used as a multipath-free truth estimate. The WAAS real-time CNMP smoothing algorithm is then applied to the original measurements, and the difference between the smoothed measurements and the multipath-free truth estimates is the observed residual error. To minimize the impacts of non-zero mean multipath biasing the truth estimates, only arcs with a continuous carrier phase greater than 7200 seconds in length are used for this analysis. The WAAS dual frequency cycle slip detector algorithm is used to detect any discontinuities in the carrier phase.

Statistics are calculated based on how well Gaussian distributions with 0.1 multiples of the CNMP standard deviation bound the observed residual error. Subsequently, these statistics are compared to a theoretical Gaussian distribution and an extensive set of plots are generated and manually reviewed. Table 9-1 shows the analysis results for the previous 12 months for all three threads of WRE at each WAAS reference station. The color coding represents four levels of performance based on the magnitude and probability distribution of the residual error and the bounding performance of the CNMP algorithm.

## **10.0 WAAS REFERENCE STATION (WRS) ANTENNA SURVEY VALIDATION**

Antenna L1 phase center position surveys were performed for all the WAAS Reference Station antennas using 24 hour sets on 01/02/17. Each WAAS WRS has three independent threads of WRE: (1) Thread A is also referred to as Thread 1, (2) Thread B is also referred to as Thread 2, and (3) Thread C is referred to as Thread 3.

Duplicate surveys were performed using both the National Geodetic Survey (NGS) Online Positioning User Service (OPUS) and the Canadian Spatial Reference System (CSRS) Precise Point Positioning (PPP) service. The IGS08 reference frame is used for the OPUS solutions. A value of -0.4445 meters was used for the antenna reference point (ARP) to antenna phase center (APC) offset for the MicroPulse MPL-WAAS-2225W WAAS antennas in the processing of the data.

The OPUS-reported RMS quality metrics were less than 2.3cm. The CSRS surveys' RSSs of the reported ECEF sigmas were less than 10 mm. The OPUS and CSRS surveys agreed to an average of 1.4 cm with a standard deviation of 6.4 mm. The maximum of difference was 3.19 cm for thread 3 at Houston, TX.

The OPUS positions were compared to the positions in the currently fielded WAAS software Build W7.134 which was fielded starting in September 2016. The OPUS surveys agree with the Build W7.134 to better or equal to 6.3 cm for most sites. Outliers include Fairbanks, which after undergoing roof repairs had antennas remounted saw a maximum difference of 8.6 cm on Thread C (FAI3); and Mexico City which, due to rapid subsidence, saw a maximum difference of 18.1 cm on Thread C (MMX3). Removing outliers, the maximum difference was 6.3 cm at San Jose Del Cabo Thread A (MSD1). The antenna positions are interpolated forward in time.

Table 10-1 lists the WAAS antenna L1 phase center positions using the OPUS data.

Figure 10-1 to Figure 10-3 show the RSS of the ECEF differences between the OPUS survey antenna phase center locations and the locations in the Build W7.134 software. Figure 10-4 to Figure 10-6 show the OPUS surveys overall RMS quality indications.

The “take action” threshold established by the WAAS Integrity Performance Panel (WIPP) is 25 cm for Mexico City and 10 cm for the remaining sites. The large MMX allowance is required because of the rapid subsidence in Mexico City (approximately 28 to 30 cm/year).

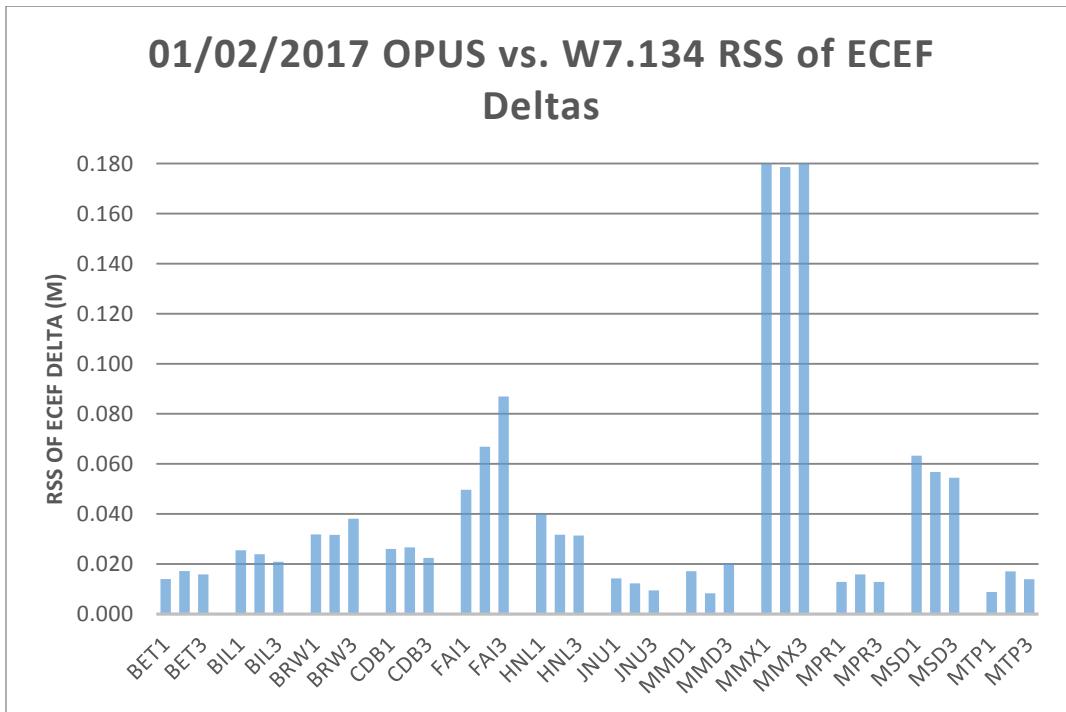

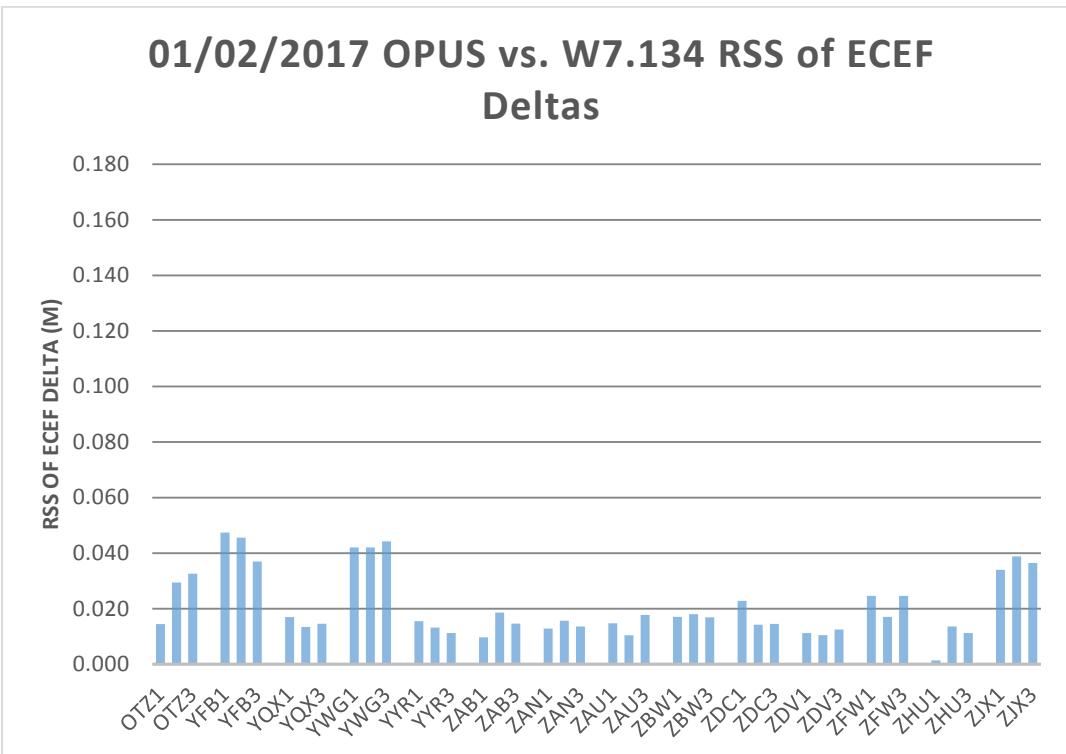

Figure 10-7 to Figure 10-9 show the RSS of the ECEF difference between the OPUS positions and the CSRS positions. Note that the OPUS positions are in IGS08 and the CSRS positions are in ITRF-2008. Figure 10-10 to Figure 10-12 show the RSS of the ECEF sigma's survey qualities reported by CSRS.

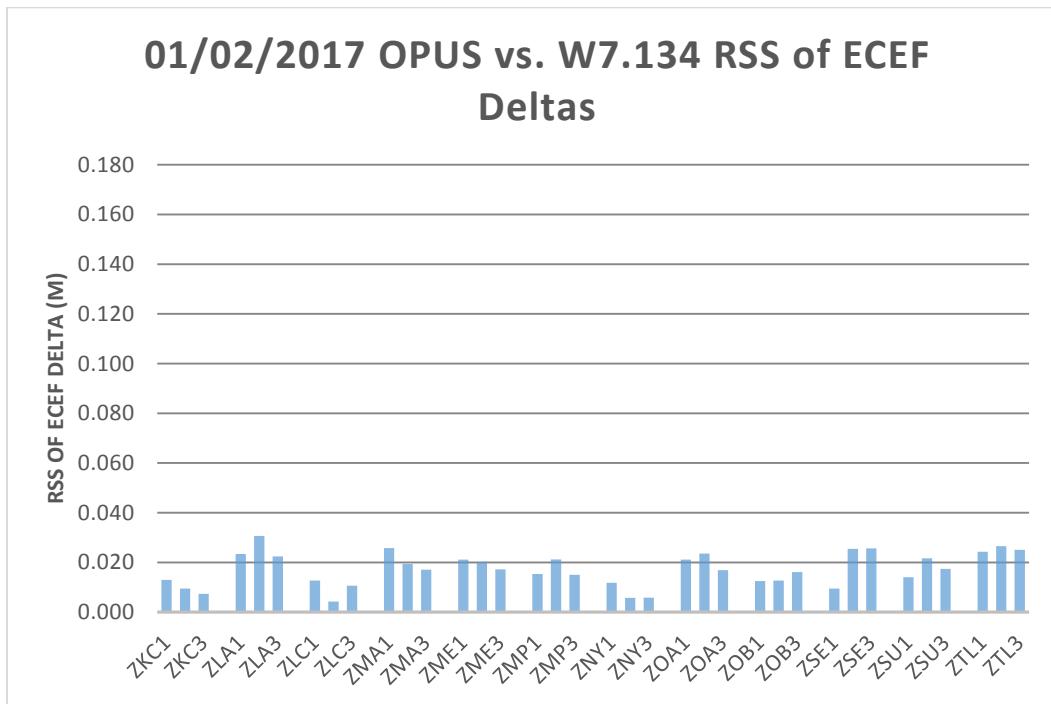

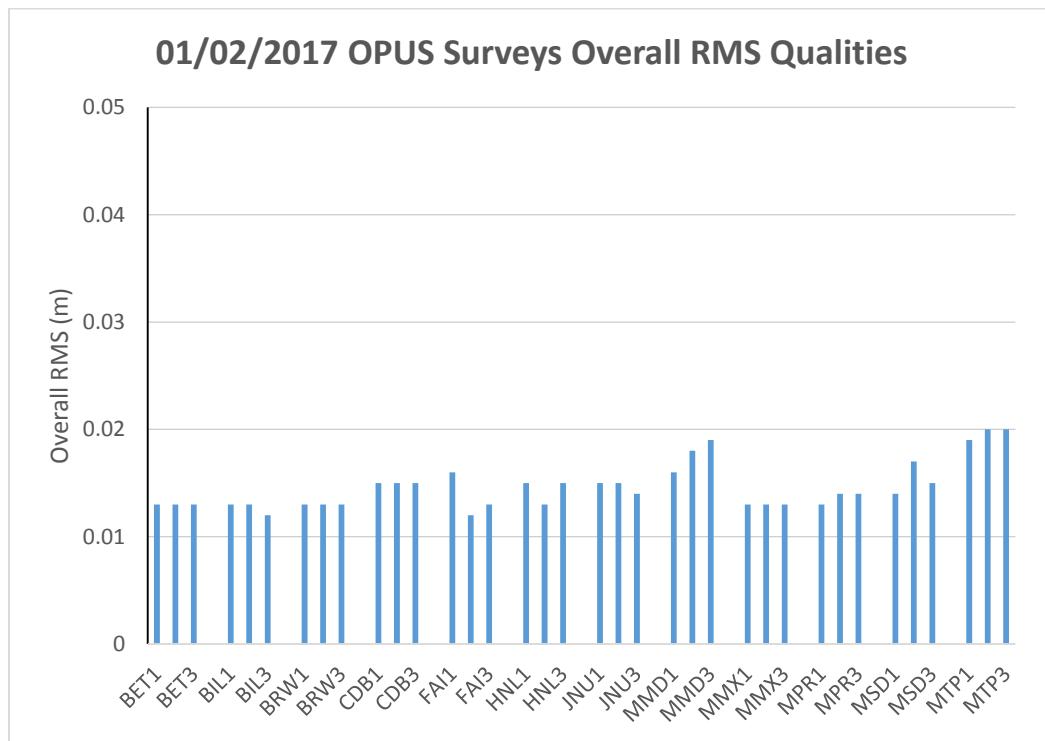

**Table 10-1 WAAS Antenna Positions (OPUS IGS08) as of 01/02/2017**

## **11.0 SIGNAL QUALITY MONITOR (SQM)**

The SQM is designed to detect signal deformations originating from the GPS or GEO satellites and to ensure that the UDRE values are sufficiently inflated given the monitor's current observations. The SQM processes various correlator spacing measurements produced by the reference station receivers. These measurements are used to form four detection metrics for each receiver and statistics are calculated based on the observed performance against "ideal" signal correlation peaks, resulting in an overall estimated deformation per satellite. The estimated deformation is compared against threshold values, which includes the acceptable error levels per UDRE value. If the estimated deformation exceeds threshold, the SQM trips for the given satellite and the UDRE value is set to "Don't Use". Currently, all 114 WAAS WREs are being used in the SQM computations because SQM depends on the entire ground network to ensure the satellite is the source of any detected problem rather than a localized affect.

The WAAS SQM offline monitoring effort includes the monitoring of the PRN type biases, trips, and the estimated deformation for each satellite (referred to as PRN bias in this report).

### **11.1 Alpha Metrics**

The alpha metrics values are pre-determined by offline integrity analysis and are defined as constants in the SQM algorithm. These values remained unchanged for this reporting period and are listed in Table 11-1. Currently there are four sets of alpha metrics in the WAAS SQM algorithm that form four detection metrics for each receiver channel. For this report, the four detection metrics (DM) will be referred to as: DM1, DM2, DM3, and DM4.

**Table 11-1 Alpha Metrics**

### **11.2 Type Bias**

The PRN type biases are evaluated as part of the WAAS SQM offline monitoring effort. Depending on the PRN number of any given GPS satellite, it can be classified into three categories of correlation function shapes: skinny (Type 0), nominal (Type 1), and broad (Type 2). Note that wideband GEOS are considered a different type (Type 3). The PRN type biases are estimates that are computed at each epoch, and daily averages are computed for each type, for four detection metrics.

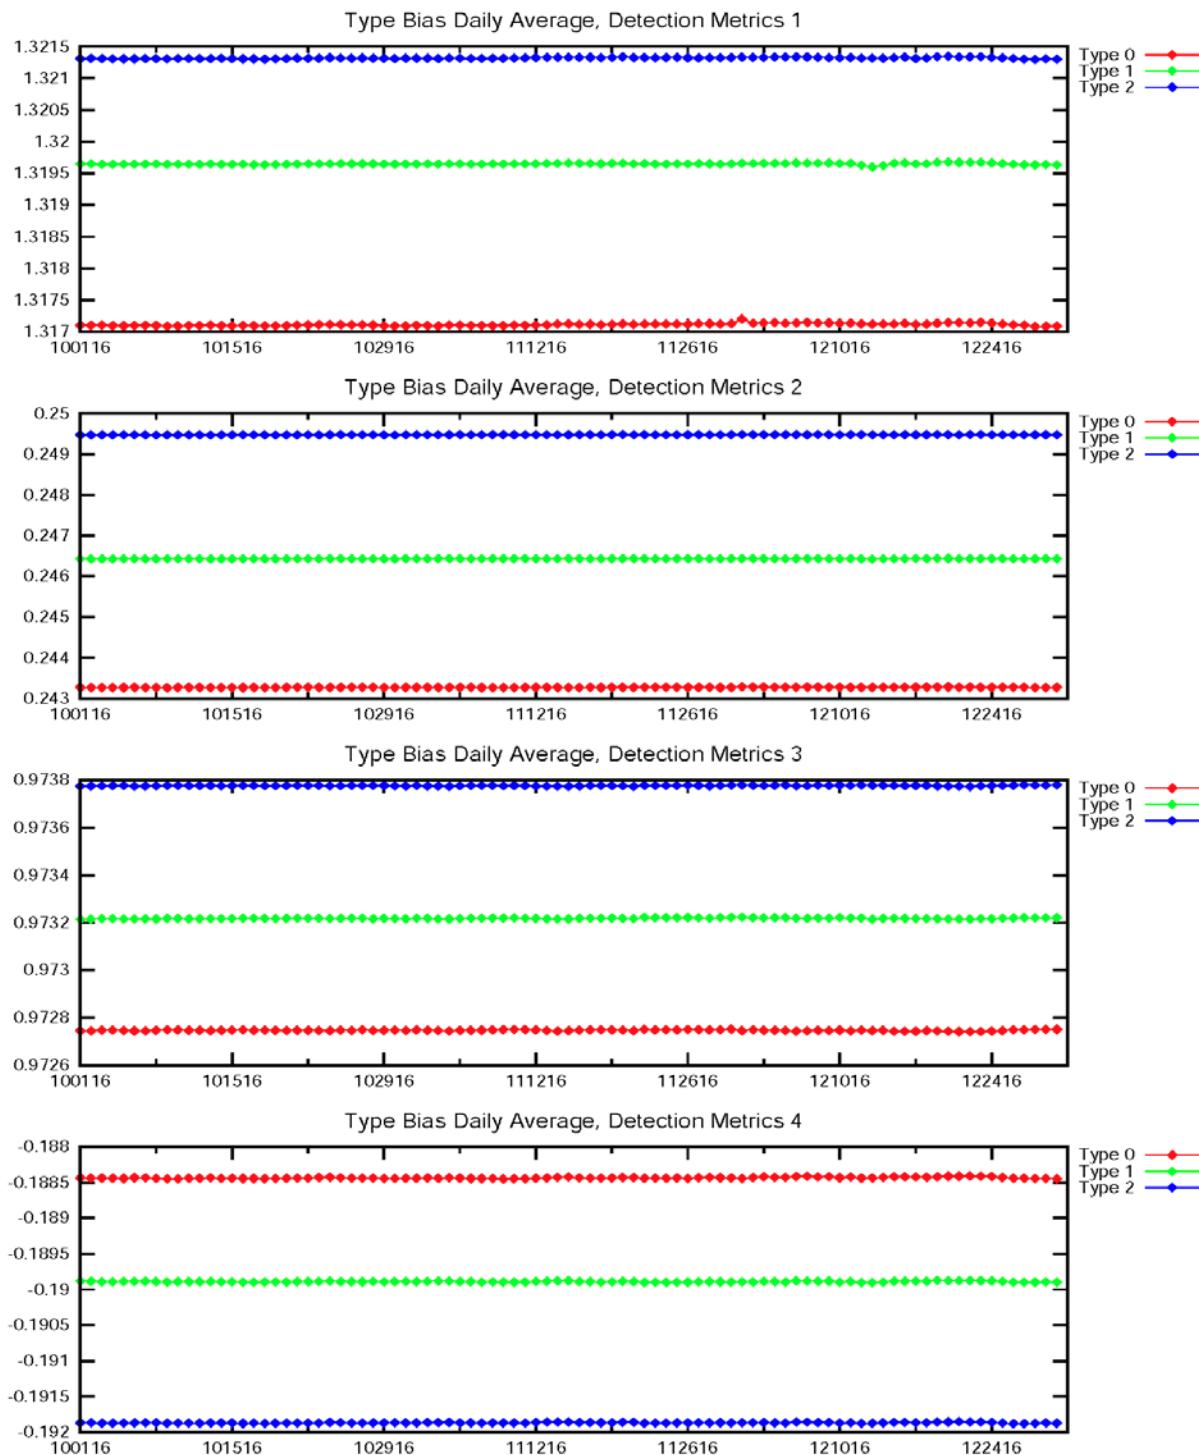

For this reporting period the GEO-type biases were not evaluated. Table 11-2 shows the rollup averages for the quarter. Table 11-3 shows the rollup averages since January 1, 2008. Figure 11-1 shows the daily averages of the four detection metrics for the quarter.

**Table 11-2 Type Bias Average for the Quarter**

<b>Detection Metric</b>	<b>Type 0</b>	<b>Type 1</b>	<b>Type 2</b>
DM 1	1.3171100	1.3196500	1.3213200
DM 2	0.2432740	0.2464310	0.2494740

DM 4	-0.1864790	-0.1882470	-0.1902840

**Figure 11-1 Type Bias Average Trend**

### 11.3 PRN Bias

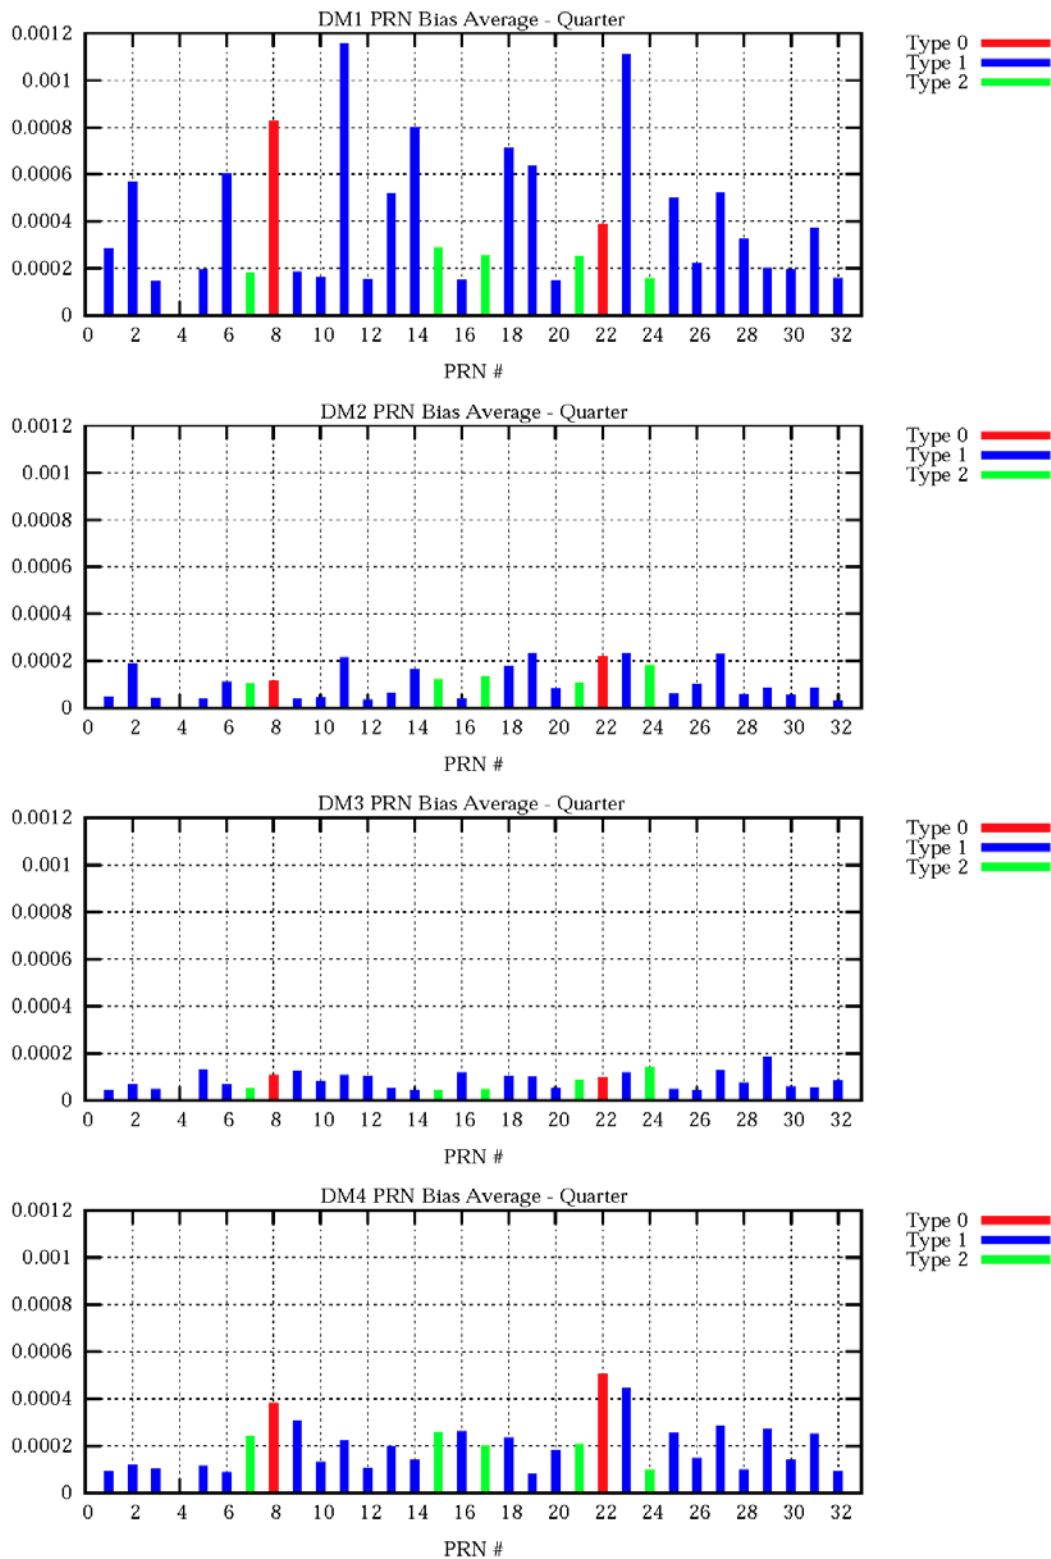

The PRN biases are evaluated as part of the WAAS SQM offline monitoring effort. A PRN bias is the overall estimated deformation per satellite across receivers. Detection metrics are adjusted for inter-receiver bias, corrected for PRN-type bias, and combined across receivers for each satellite. Relying on the assertion that the majority of the SV signals are healthy and normal, detection metrics are normalized over all the orbiting satellites, which results in an overall PRN bias for each satellite. PRN biases are collected at each epoch and daily averages are computed for each satellite, for four detection metrics.

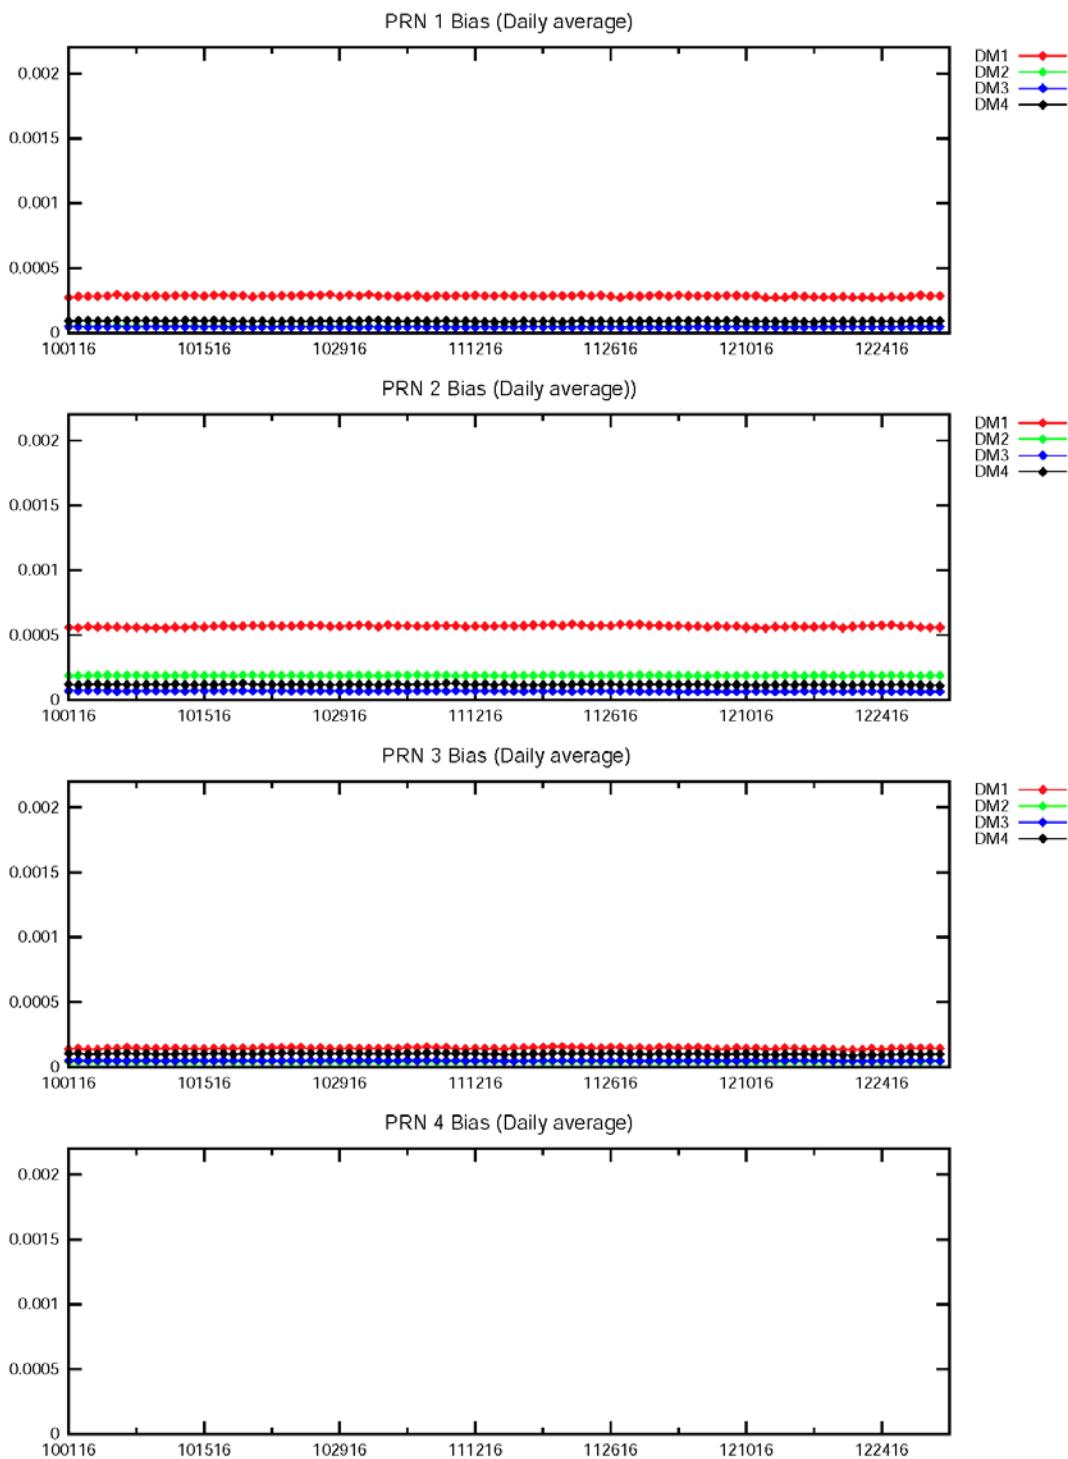

Table 11-4 and Figure 11-2 show the rollup PRN bias averages for the quarter with the maximum values for each detection metrics as followed: (1) the maximum average for DM1 is 0.0011570 observed on PRN-11, (2) the maximum average for DM2 is 0.0002304 observed on PRN-23, (3) the maximum average for DM3 is 0.0001842 observed on PRN-29, (4) the maximum average for DM4 is 0.0005058 observed on PRN-22.

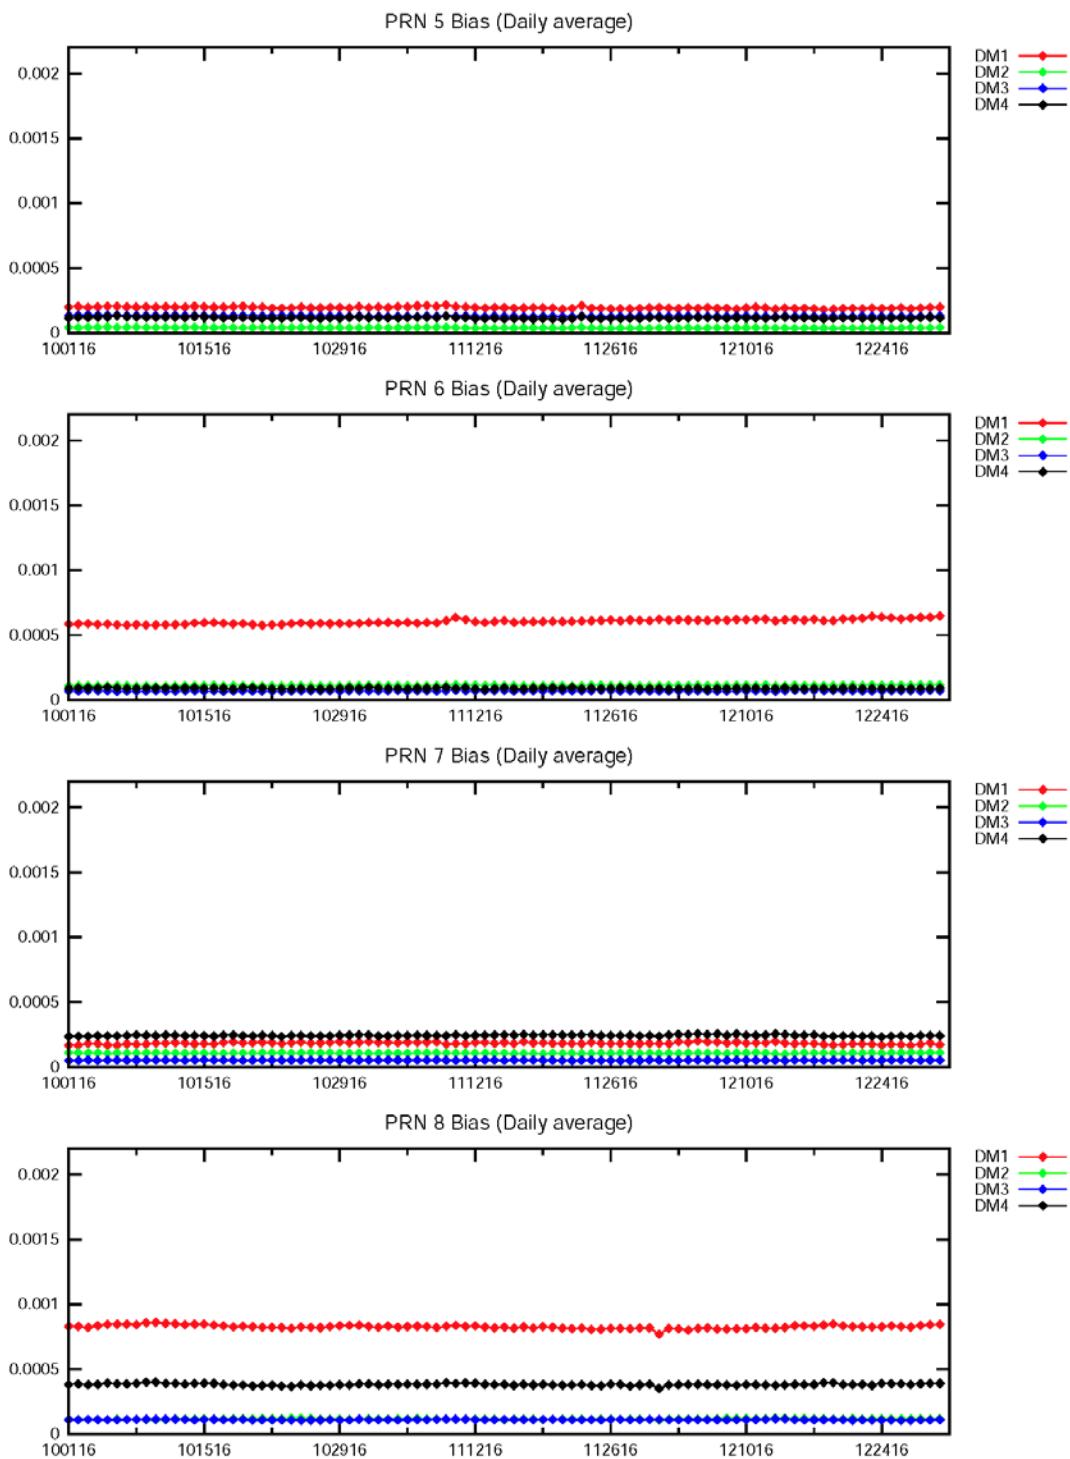

Figure 11-3 to Figure 11-10 provide the daily PRN bias for each PRN, for four detection metrics. Small bumps were due to NANUs.

#### **11.4 SQM Trips**

A SQM trip occurs when the estimated deformation exceeds threshold. There were no SQM trips for this quarter.

## Appendix A: Glossary and Acronyms

### **General Terms and Definitions**

**Alert.** An alert is an indication provided by the GPS/WAAS equipment to inform the user when the positioning performance achieved by the equipment does not meet the integrity requirements.

**AMR.** GEO PRN-133.

**APC.** Antenna Phase Center.

**ARP.** Antenna Reference Point.

**Availability.** The availability of a navigation system is the ability of the system to provide the required function and performance at the initiation of the intended operation. Availability is an indication of the ability of the system to provide usable service within the specified coverage area.

**C&V.** The Correction and Verification Subsystem.

**CNMP.** Code Noise and Multipath.

**CONUS.** Continental United States.

**Continuity.** The continuity of a system is the ability of the total system (comprising all elements necessary to maintain aircraft position within the defined airspace) to perform its function without interruption during the intended operation. More specifically, continuity is the probability that the specified system performance will be maintained for the duration of a phase of operation, presuming that the system was available at the beginning of that phase of operation.

**Coverage.** The coverage provided by a radio navigation system is that surface area or space volume in which the signals are adequate to permit the user to determine position to a specified level of accuracy. Coverage is influenced by system geometry, signal power levels, receiver sensitivity, atmospheric noise conditions, and other factors that affect signal availability.

**CRE.** GEO PRN-138.

**CRW.** GEO PRN-135.

**CSRS.** Canadian Spatial Reference System.

**Dilution of Precision (DOP).** The magnifying effect on GPS position error induced by mapping GPS ranging errors into position through the position solution. The DOP may be represented in any user local coordinate desired. Examples are HDOP for local horizontal, VDOP for local vertical, PDOP for all three coordinates, and TDOP for time.

**DM.** Detection Metrics.

**DR.** Discrepancy Report.

**ECEF.** Earth-Centered, Earth-Fixed.

**FAA.** Federal Aviation Administration.

**FD.** Fault Detection.

**Fault Detection and Exclusion (FDE).** Fault detection and exclusion is a receiver processing scheme that autonomously provides integrity monitoring for the position solution, using redundant range measurements. The FDE

consists of two distinct parts: fault detection and fault exclusion. The fault detection part detects the presence of an unacceptably large position error for a given mode of flight. Upon the detection, fault exclusion follows and excludes the source of the unacceptably large position error, thereby allowing navigation to return to normal performance without an interruption in service.

**GEO.** Geostationary Satellite.

**GMT.** Greenwich Mean Time.

**Global Positioning System (GPS).** A space-based positioning, velocity, and time system composed of space, control, and user segments. The space segment, when fully operational, will be composed of 24 satellites in six orbital planes. The control segment consists of five monitor stations, three ground antennas, and a master control station. The user segment consists of antennas and receiver-processors that provide positioning, velocity, and precise timing to the user.

**Grid Ionospheric Vertical Error (GIVE).** GIVEs indicate the accuracy of ionospheric vertical delay correction at a geographically defined ionospheric grid point (IGP). WAAS transmits one GIVE for each IGP in the mask.

**GUS.** GEO Uplink System.

**Hazardous Misleading Information (HMI).** Hazardous misleading information is any position data that has an error larger than the current protection level (HPL/VPL), without any indication of the error (e.g., alert message sequence).

**Horizontal Alert Limit (HAL).** The Horizontal Alert Limit (HAL) is the radius of a circle in the horizontal plane (the local plane tangent to the WGS-84 ellipsoid), with its center being at the true position, which describes the region that is required to contain the indicated horizontal position with a probability of  $1-10^{-7}$  per flight hour, for a particular navigation mode, assuming the probability of a GPS satellite integrity failure being included in the position solution is less than or equal to  $10^{-4}$  per hour.

**HPE.** Horizontal Position Error.

**Horizontal Protection Level (HPL).** The Horizontal Protection Level is the radius of a circle in the horizontal plane (the plane tangent to the WGS-84 ellipsoid), with its center being at the true position, which describes the region that is assured to contain the indicated horizontal position. It is based upon the error estimates provided by WAAS.

**IAP.** Instrument Approach Procedures

**IGS.** International GPS Service.

**Ionospheric Grid Point (IGP).** IGP is a geographically defined point for which the WAAS provides the vertical ionospheric delay.

**Kp.** Planetary Index.

**LNAV.** Lateral Navigation.

**LP.** Localizer Performance. LP is a WAAS operational service level with a HAL equal to 40 meters.

**LPV.** Localizer Performance with Vertical Guidance. LPV is a WAAS operational service level with a HAL equal to 40 meters and a VAL equal to 50 meters.

**LPV200.** Localizer Performance with Vertical Guidance to 200 ft decision height. LPV200 is a WAAS operational service level with a HAL equal to 40 meters and a VAL equal to 35 meters.

**MOPS.** Minimum Operational Performance Standards.

**NANU.** Notice Advisory to Navstar Users. NANU is an advisory message to inform users of a change in the GPS constellation. These messages inform users in advance of planned maintenance and also notify users of unscheduled outages.

**NAS.** National Airspace System.

**Navigation Message.** Message structure designed to carry navigation data.

**NGS.** National Geodetic Survey.

**Non-Precision Approach (NPA) Navigation Mode.** The Non-Precision Approach navigation mode refers to the navigation solution operating with a minimum of four satellites with fast and long term WAAS corrections (no WAAS ionospheric corrections) available.

**NTSB.** National Satellite Test Bed.

**OCONUS.** Outside Contiguous United States.

**OPUS.** Online Positioning Use Server.

**PAN.** Performance Analysis Report.

**PID.** Programmable Indicator Data.

**Position Solution.** The use of ranging signal measurements and navigation data from at least four satellites to solve for three position coordinates and a time offset.

**PPP.** Precise Point Positioning.

**Precision Approach (PA) Navigation Mode.** The Precision Approach navigation mode refers to the navigation solution operating with a minimum of four satellites with all WAAS corrections (fast, long term, and ionospheric) available.

**PRN.** Pseudo-Random Noise.

**RAIM.** Receiver Autonomous Integrity Monitoring.

**RFI.** Radio Frequency Interference.

**RNAV.** Area Navigation.

**RNP.** Required Navigation Performance.

**RSS.** Residual Sum of Squares.

**Selective Availability.** Protection technique employed by the DOD to deny full system accuracy to unauthorized users.

**SBAS.** Space Based Augmentation System.

**SIS.** Signal in Space

**Signal Quality Monitor (SQM).** SQM monitors correlator measurements to detect signal deformations that originate in the GPS or GEO satellites and ensures that the UDREs are sufficiently inflated to protect given the monitor's current observations.

**SSM.** System Support Modification.

**Standard Positioning Service (SPS).** Three-dimensional position and time determination capability provided to a user equipped with a minimum capability GPS SPS receiver in accordance with GPS national policy and the performance specifications.

**SV.** Space Vehicle.

**SVN.** Space Vehicle Number.

**TCS.** Terrestrial Communications Subsystem.

**TOW.** Time of GPS Week.

**User Differential Range Error (UDRE).** UDRE's indicate the accuracy of combined fast and slow error corrections. WAAS transmits one UDRE for each satellite in the mask.

**Vertical Alert Limit (VAL).** The Vertical Alert Limit is half the length of a segment on the vertical axis (perpendicular to the horizontal plane of WGS-84 ellipsoid), with its center being at the true position, which describes the region that is required to contain the indicated vertical position with a probability of  $1-10^{-7}$  per flight hour, for a particular navigation mode, assuming the probability of a GPS satellite integrity failure being included in the position solution is less than or equal to  $10^{-4}$  per hour.

**VPE. Vertical Position Error.**

**Vertical Protection Level (VPL).** The Vertical Protection Level is half the length of a segment on the vertical axis (perpendicular to the horizontal plane of WGS-84 ellipsoid), with its center being at the true position, which describes the region that is assured to contain the indicated vertical position. It is based upon the error estimates provided by WAAS.

**VNAV.** Vertical Navigation.

**Wide Area Augmentation System (WAAS).** The WAAS is made up of an integrity reference monitoring network, processing facilities, geostationary satellites, and control facilities. Wide area reference stations and integrity monitors are widely dispersed data collection sites that contain GPS/WAAS ranging receivers that monitor all signals from the GPS, as well as the WAAS geostationary satellites. The reference stations collect measurements from the GPS and WAAS satellites so that differential corrections, ionospheric delay information, GPS/WAAS accuracy, WAAS network time, GPS time, and UTC can be determined. The wide area reference station and integrity monitor data are forwarded to the central data processing sites. These sites process the data in order to determine differential corrections, ionospheric delay information, and GPS/WAAS accuracy, as well as verify residual error bounds for each monitored satellite. The central data processing sites also generate navigation messages for the geostationary satellites and WAAS messages. This information is modulated on the GPS-like signal and broadcast to the users from geostationary satellites.

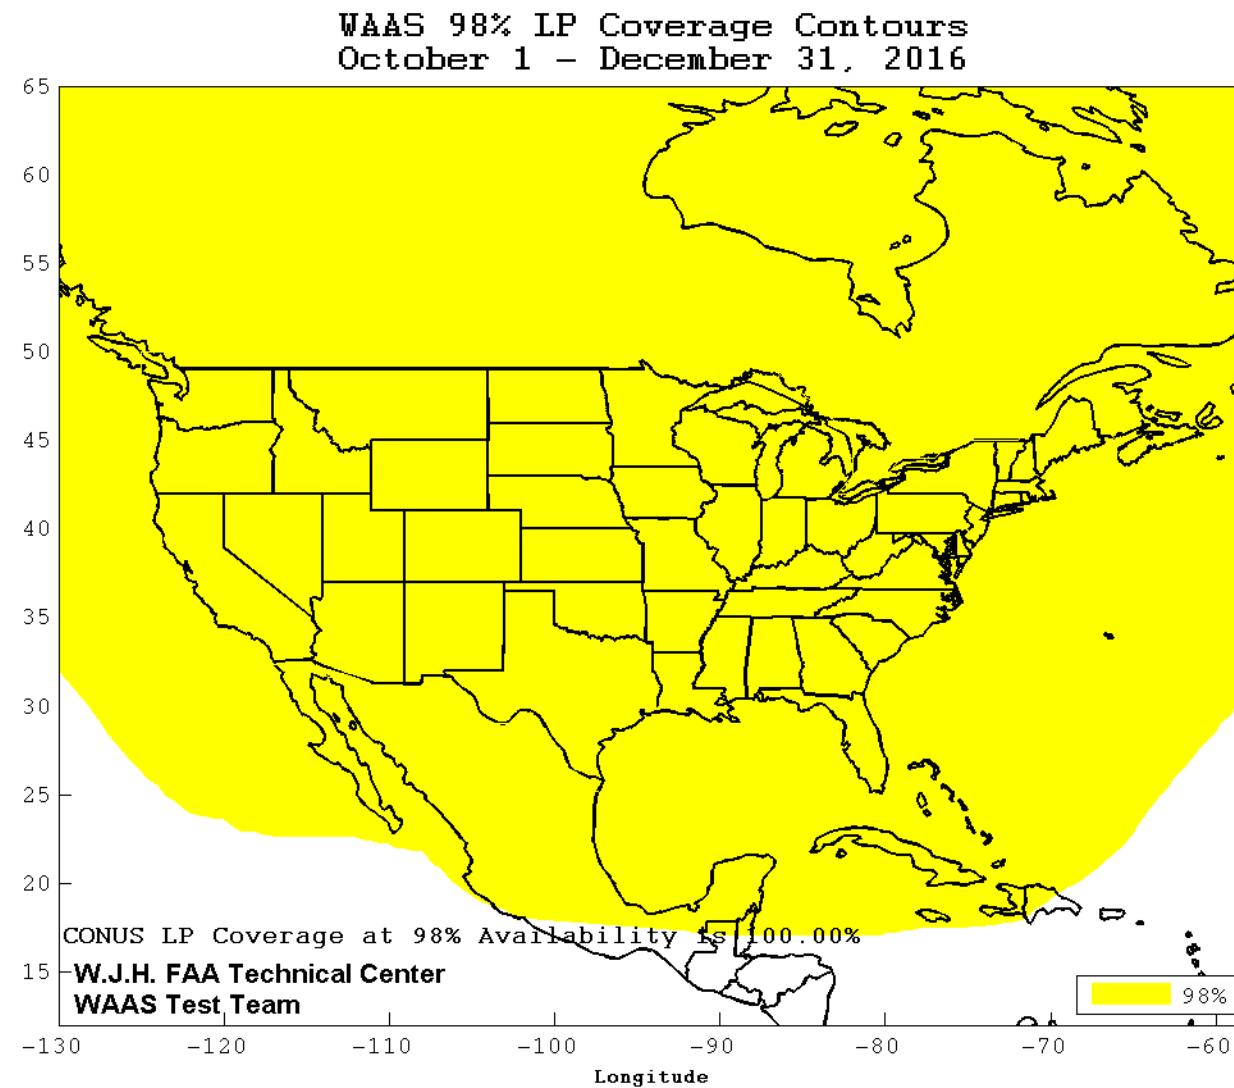

**WIPP.** WAAS Integrity Performance Panel.

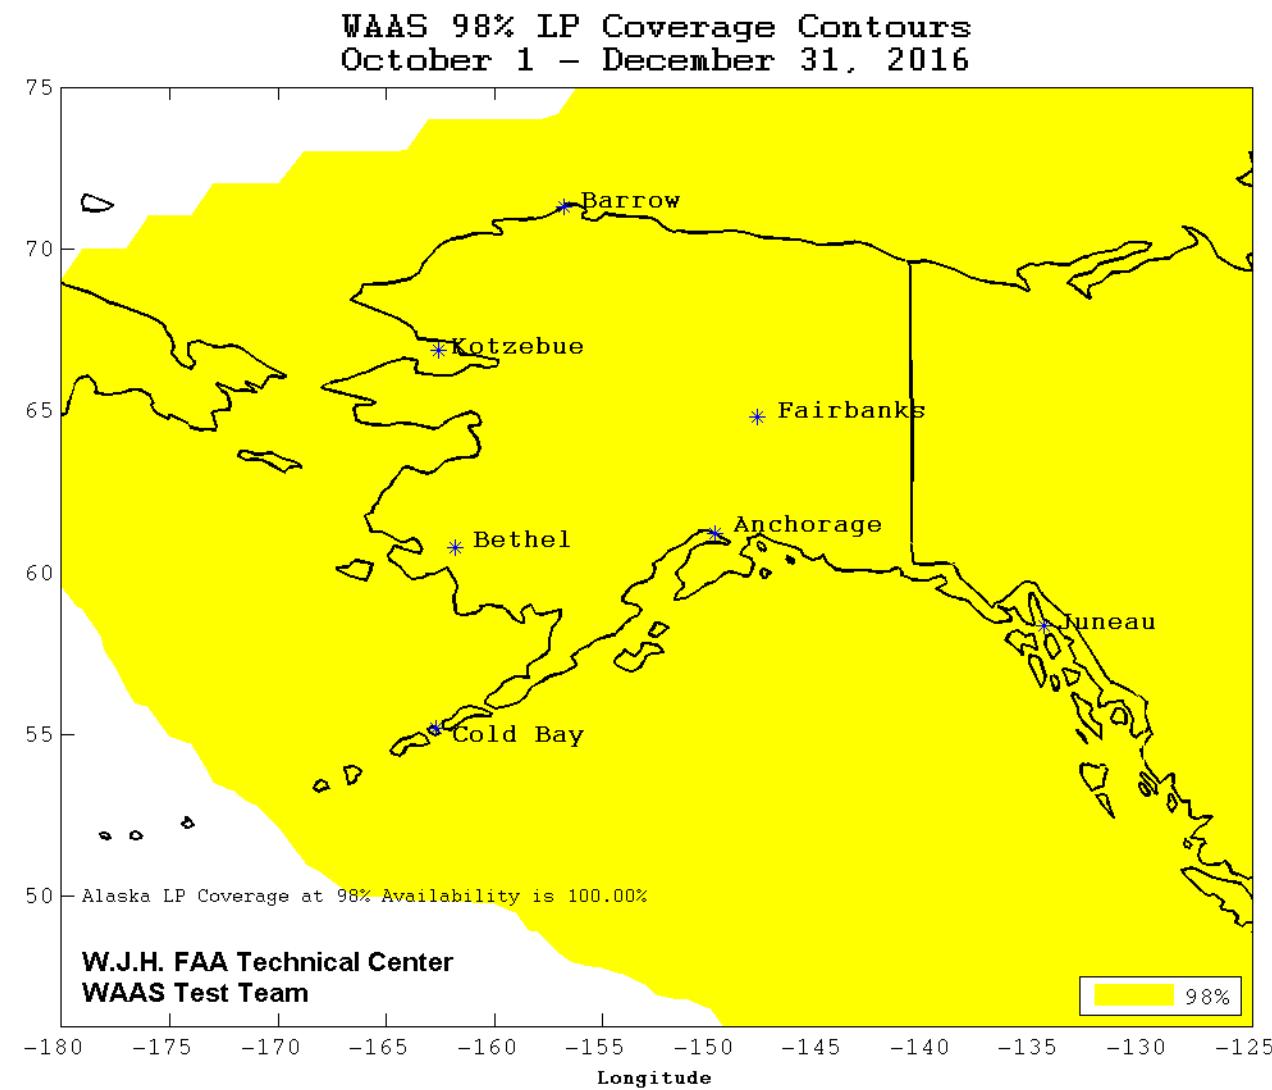

**WRE.** Wide Area Reference Equipment.

**WRS.** WAAS Reference Station.

**Appendix B: Additional Coverage Plots**

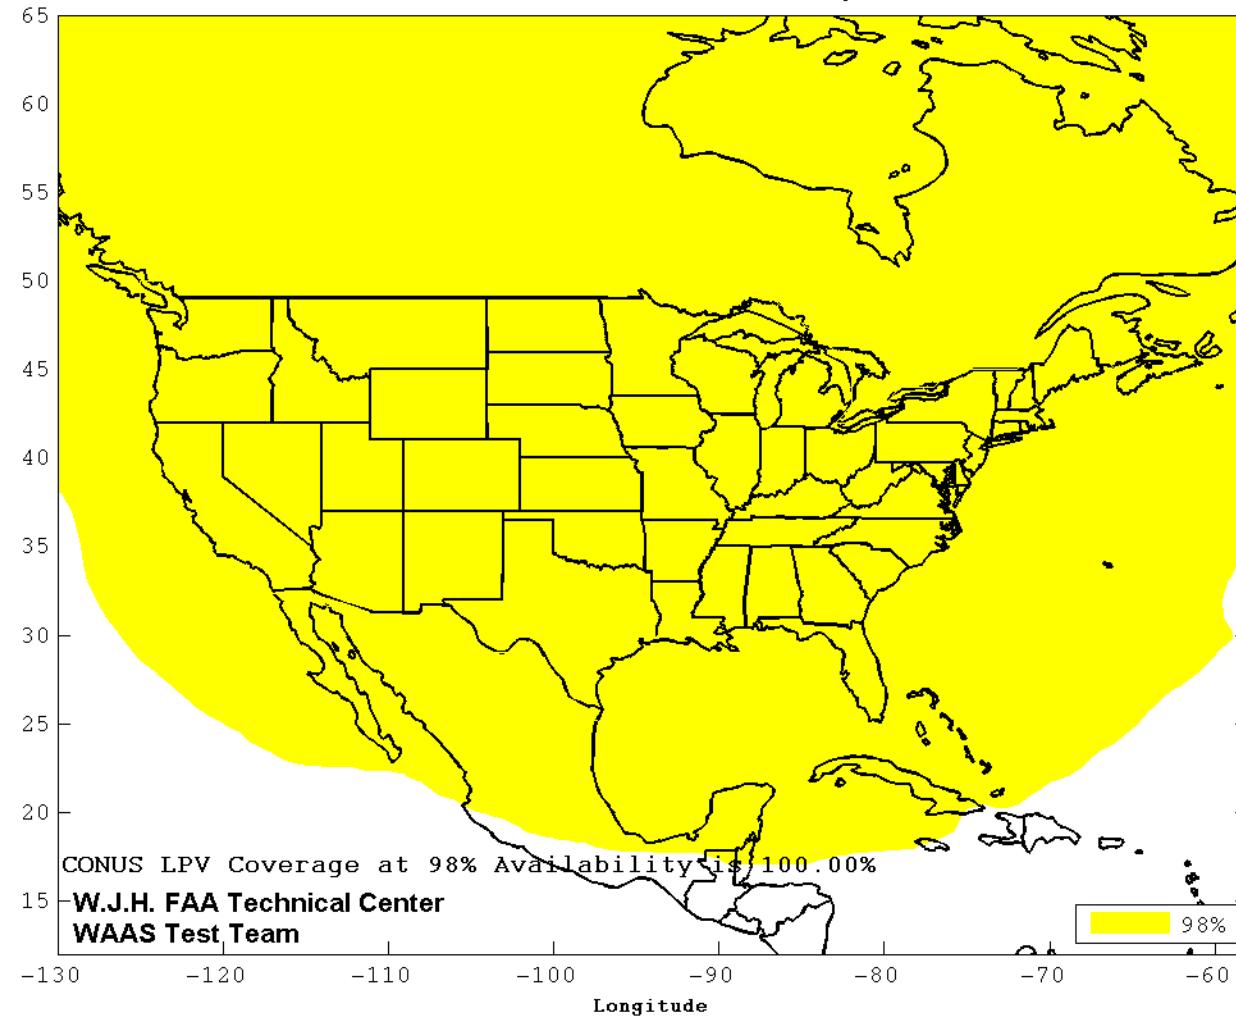

Appendix B includes the coverage plots with 99% LPV200 availability contour, 98% LPV availability contours, and 98% LP availability contours for the quarter. Figure B-1 shows CONUS coverage with 98% LP availability contour. Figure B-2 shows Alaska coverage with 98% LP availability contour. Figure B-3 shows CONUS coverage with 98% LPV availability contour. Figure B-4 shows Alaska coverage with 98% LPV availability contour. Figure B-5 shows CONUS coverage with 99% LPV200 availability contour. Figure B-6 shows Alaska coverage with 99% LPV200 availability contour.
